Data Sheet *(Advance Information)*

SPANSION™

Notice to Readers: This document contains information on one or more products under development at Spansion Inc. The information is intended to help you evaluate this product. Do not design in this product without contacting the factory. Spansion Inc. reserves the right to change or discontinue work on this proposed product without notice.

Notice On Data Sheet Designations

Spansion Inc. issues data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle, including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of Spansion data sheet designations are presented here to highlight their presence and definitions.

Advance Information

The Advance Information designation indicates that Spansion Inc. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue. Spansion Inc. therefore places the following conditions upon Advance Information content:

> "This document contains information on one or more products under development at Spansion Inc. The information is intended to help you evaluate this product. Do not design in this product without contacting the factory. Spansion Inc. reserves the right to change or discontinue work on this proposed product without notice."

Preliminary

The Preliminary designation indicates that the product development has progressed such that a commitment to production has taken place. This designation covers several aspects of the product life cycle, including product qualification, initial production, and the subsequent phases in the manufacturing process that occur before full production is achieved. Changes to the technical specifications presented in a Preliminary document should be expected while keeping these aspects of production under consideration. Spansion places the following conditions upon Preliminary content:

> "This document states the current technical specifications regarding the Spansion product(s) described herein. The Preliminary status of this document indicates that product qualification has been completed, and that initial production has begun. Due to the phases of the manufacturing process that require maintaining efficiency and quality, this document may be revised by subsequent versions or modifications due to changes in technical specifications."

Combination

Some data sheets contain a combination of products with different designations (Advance Information, Preliminary, or Full Production). This type of document distinguishes these products and their designations wherever necessary, typically on the first page, the ordering information page, and pages with the DC Characteristics table and the AC Erase and Program table (in the table notes). The disclaimer on the first page refers the reader to the notice on this page.

Full Production (No Designation on Document)

When a product has been in production for a period of time such that no changes or only nominal changes are expected, the Preliminary designation is removed from the data sheet. Nominal changes may include those affecting the number of ordering part numbers available, such as the addition or deletion of a speed option, temperature range, package type, or V_{IO} range. Changes may also include those needed to clarify a description or to correct a typographical error or incorrect specification. Spansion Inc. applies the following conditions to documents in this category:

> "This document states the current technical specifications regarding the Spansion product(s) described herein. Spansion Inc. deems the products to have been in sufficient production volume such that subsequent versions of this document are not expected to change. However, typographical or specification corrections, or modifications to the valid combinations offered may occur."

Questions regarding these document designations may be directed to your local sales office.

S29GL-P MirrorBit™ Flash Family

S29GL01GP, S29GL512P, S29GL256P, S29GL128P
1 Gigabit, 512 Megabit , 256 Megabit and 128 Megabit
3.0 Volt-only Page Mode Flash Memory featuring
90 nm MirrorBit Process Technology

SPANSION™

Data Sheet (Advance Information)

General Description

The Spansion S29GL01G/512/256/128P are Mirrorbit™ Flash products fabricated on 90 nm process technology. These devices offer a fast page access time of 25 ns with a corresponding random access time of 110 ns. They feature a Write Buffer that allows a maximum of 32 words/64 bytes to be programmed in one operation, resulting in faster effective programming time than standard programming algorithms. This makes these devices ideal for today's embedded applications that require higher density, better performance and lower power consumption.

Distinctive Characteristics

- **Single 3V read/program/erase (2.7-3.6 V)**
- **Enhanced VersatileI/O™ control**
  - All input levels (address, control, and DQ input levels) and outputs are determined by voltage on V_{IO} input. V_{IO} range is 1.65 to V_{CC}
- **90 nm MirrorBit process technology**
- **8-word/16-byte page read buffer**
- **32-word/64-byte write buffer reduces overall programming time for multiple-word updates**
- **Secured Silicon Sector region**
  - 128-word/256-byte sector for permanent, secure identification through an 8-word/16-byte random Electronic Serial Number
  - Can be programmed and locked at the factory or by the customer
- **Uniform 64Kword/128KByte Sector Architecture**
  - S29GL01GP: One thousand twenty-four sectors
  - S29GL512P: Five hundred twelve sectors
  - S29GL256P: Two hundred fifty-six sectors
  - S29GL128P: One hundred twenty-eight sectors
- **100,000 erase cycles per sector typical**
- **20-year data retention typical**

- **Offered Packages**
  - 56-pin TSOP
  - 64-ball Fortified BGA
- **Suspend and Resume commands for Program and Erase operations**
- **Write operation status bits indicate program and erase operation completion**
- **Unlock Bypass Program command to reduce programming time**
- **Support for CFI (Common Flash Interface)**
- **Persistent and Password methods of Advanced Sector Protection**
- **WP#/ACC input**
  - Accelerates programming time (when V_{ACC} is applied) for greater throughput during system production
  - Protects first or last sector regardless of sector protection settings
- **Hardware reset input (RESET#) resets device**
- **Ready/Busy# output (RY/BY#) detects program or erase cycle completion**

Performance Characteristics

Max. Read Access Times (ns)*						
	512/256/128 Mb**			1 Gb		
Parameter	V1	V2	V3	V1	V2	V3
Random Access Time (t$_{ACC}$)	100	110	120	110	120	130
Page Access Time (t$_{PACC}$)	25	25	25	25	25	25
CE# Access Time (t$_{CE}$)	110	110	120	110	120	130
OE# Access Time (t$_{OE}$)	25	25	30	25	25	30

* Access times are dependent on V_{CC} and V_{IO} operating ranges.
See Ordering Information page for further details.
V1: V_{CC} = 3.0–3.6 V. V2: V_{CC} = V_{IO} = 2.7–3.6 V.
V3: V_{IO} = 1.65–V_{CC}, V_{CC} = 3 V.
** Contact a sales representative for availability.

Current Consumption (typical values)	
Random Access Read	30 mA
8-Word Page Read	1 mA
Program/Erase	50 mA
Standby	1 µA

Program & Erase Times (typical values)	
Single Word Programming	60 µs
Effective Write Buffer Programming (V_{CC}) Per Word	15 µs
Effective Write Buffer Programming (V_{ACC}) Per Word	15 µs
Sector Erase Time (64 Kword Sector)	0.5 s

Notes
1. Type 0 is standard. Specify other options as required.
2. TSOP package marking omits packing type designator from ordering part number.
3. BGA package marking omits leading "S29" and packing type designator from ordering part number.
4. Contact local sales representative for availability, and on the following part numbers: S29GL01GP12TFI010, S29GL01GP12FFI010, S29GL01GP13TFIV10, S29GL01GP13FFIV10.

1.1 Recommended Combinations

Recommended Combinations list configurations planned to be supported in volume for this device. Consult your local sales office to confirm availability of specific recommended combinations and to check on newly released combinations.

2. Input/Output Descriptions & Logic Symbol

Table 2.1 identifies the input and output package connections provided on the device.

Table 2.1 Input/Output Descriptions

Symbol	Type	Description
A25–A0	Input	Address lines for GL01GP A24–A0 for GL512P A23–A0 for GL256P, A22–A0 for GL128P.
DQ14–DQ0	I/O	Data input/output.
DQ15	I/O	DQ15: Data input/output in word mode . A-1: LSB address input in byte mode.
CE#	Input	Chip Enable.
OE#	Input	Output Enable.
WE#	Input	Write Enable.
V_{CC}	Supply	Device Power Supply.
V_{IO}	Supply	Versatile IO Input.
V_{SS}	Supply	Ground.
NC	No Connect	Not connected internally.
RY/BY#	Output	Ready/Busy. Indicates whether an Embedded Algorithm is in progress or complete. At V_{IL}, the device is actively erasing or programming. At High Z, the device is in ready.
BYTE#	Input	Selects data bus width. At V_{IL}, the device is in byte configuration and data I/O pins DQ0-DQ7 are active. At V_{IH}, the device is in word configuration and data I/O pins DQ0-DQ15 are active.
RESET#	Input	Hardware Reset. Low = device resets and returns to reading array data.
WP#/ACC	Input	Write Protect/Acceleration Input. At V_{IL}, disables program and erase functions in the outermost sectors. At V_{HH}, accelerates programming; automatically places device in unlock bypass mode. Should be at V_{IH} for all other conditions.
RFU	Reserved	Reserved for future use.

4.2 Special Handling Instructions for BGA Package

Special handling is required for Flash Memory products in BGA packages.

Flash memory devices in BGA packages may be damaged if exposed to ultrasonic cleaning m ethods. The package and/or data integrity may be compromised if the package body is exposed to temperatures above 150°C for prolonged periods of time.

6. Product Overview

The S29GL-P family consists of 1 Gb, 512 Mb, 256 Mb and 128 Mb, 3.0-volt-only, page mode Flash devices optimized for today's embedded designs that demand a large storage array and rich functionality. These devices are manufactured using 90 nm MirrorBit technology. These products offer uniform 64 Kword (128 Kb) uniform sectors and feature VersatileIO control, allowing control and I/O signals to operate from 1.65 V to V_{CC}. Additional features include:

- Single word programming or a 32-word buffer for an increased programming speed

- Program Suspend/Resume and Erase Suspend/Resume

- Advanced Sector Protection methods for protecting sectors as required

- 128 words of Secured Silicon area for storing customer and factory secured information. The Secured Silicon Sector is One Time Programmable.

6.1 Memory Map

The S29GL-P devices consist of uniform 64 Kword (128 Kb) sectors organized as shown in Table 6.1–Table 6.4.

Table 6.1 S29GL01GP Sector & Memory Address Map

Uniform Sector Size	Sector Count	Sector Range	Address Range (16-bit)	Notes
64 Kword/128 Kb	1024	SA00	0000000h - 000FFFFh	Sector Starting Address
		:	:	
		SA1023	3FF0000H - 3FFFFFFh	Sector Ending Address

Note
This table has been condensed to show sector-related information for an entire device on a single page. Sectors and their address ranges that are not explicitly listed (such as SA001-SA1022) have sector starting and ending addresses that form the same pattern as all other sectors of that size. For example, all 128 Kb sectors have the pattern xxx0000h-xxxFFFFh.

Table 6.2 S29GL512P Sector & Memory Address Map

Uniform Sector Size	Sector Count	Sector Range	Address Range (16-bit)	Notes
64 Kword/128 Kb	512	SA00	0000000h - 000FFFFh	Sector Starting Address
		:	:	
		SA511	1FF0000H - 1FFFFFFh	Sector Ending Address

Note
This table has been condensed to show sector-related information for an entire device on a single page. Sectors and their address ranges that are not explicitly listed (such as SA001-SA510) have sector starting and ending addresses thatthe same pattern as all other sectors of that size. For example, all 128 Kb sectors have the pattern xxx0000h-xxxFFFFh.

Table 6.3 S29GL256P Sector & Memory Address Map

Uniform Sector Size	Sector Count	Sector Range	Address Range (16-bit)	Notes
64 Kword/128 Kb	256	SA00	0000000h - 000FFFFh	Sector Starting Address
		:	:	
		SA255	0FF0000H - 0FFFFFFh	Sector Ending Address

Note
This table has been condensed to show sector-related information for an entire device on a single page. Sectors and their address ranges that are not explicitly listed (such as SA001-SA254) have sector starting and ending addresses that form the same pattern as all other sectors of that size. For example, all 128 Kb sectors have the pattern xxx0000h-xxxFFFFh.

Table 6.4 S29GL128P Sector & Memory Address Map

Uniform Sector Size	Sector Count	Sector Range	Address Range (16-bit)	Notes
		SA00	0000000h - 000FFFFh	Sector Starting Address
64 Kword/128 Kb	128	:	:	
		SA127	07F0000 - 7FFFFF	Sector Ending Address

Note

This table has been condensed to show sector-related information for an entire device on a single page. Sectors and their address ranges that are not explicitly listed (such as SA001-SA510) have sector starting and ending addresses that form the same pattern as all other sectors of that size. For example, all 128 Kb sectors have the pattern xxx0000h-xxxFFFFh.

7. Device Operations

This section describes the read, program, erase, handshaking, and reset features of the Flash devices.

Operations are initiated by writing specific commands or a sequence with specific address and data patterns into the command registers (see Table 12.1 through Table 12.4). The command register itself does not occupy any addressable memory location; rather, it is composed of latches that store the commands, along with the address and data information needed to execute the command. The contents of the register serve as input to the internal state machine and the state machine outputs dictate the function of the device. Writing incorrect address and data values or writing them in an improper sequence may place the device in an unknown state, in which case the system must write the reset command to return the device to the reading array data mode.

7.1 Device Operation Table

The device must be setup appropriately for each operation. Table 7.1 describes the required state of each control pin for any particular operation.

Table 7.1 Device Operations

Operation	CE#	OE#	WE#	RESET#	WP#/ACC	Addresses (Note 1)	DQ0–DQ7	DQ8–DQ15 BYTE#= V_{IH}	DQ8–DQ15 BYTE#= V_{IL}
Read	L	L	H	H	X	A_{IN}	D_{OUT}	D_{OUT}	DQ8–DQ14 = High-Z, DQ15 = A-1
Write (Program/Erase)	L	H	L	H	(Note 2)	A_{IN}	(Note 3)	(Note 3)	
Accelerated Program	L	H	L	H	V_{HH}	A_{IN}	(Note 3)	(Note 3)	
Standby	$V_{CC} \pm 0.3$ V	X	X	$V_{CC} \pm 0.3$ V	H	X	High-Z	High-Z	High-Z
Output Disable	L	H	H	H	X	X	High-Z	High-Z	High-Z
Reset	X	X	X	L	X	X	High-Z	High-Z	High-Z

Legend

L = Logic Low = V_{IL}, H = Logic High = V_{IH}, V_{HH} = 11.5–12.5V, X = Don't Care, A_{IN} = Address In, D_{IN} = Data In, D_{OUT} = Data Out

Notes

1. *Addresses are AMax:A0 in word mode; A_{Max}:A-1 in byte mode.*

2. *If WP# = V_{IL}, on the outermost sector remains protected. If WP# = V_{IH}, the outermost sector is unprotected. All sectors are unprotected when shipped from the factory (The Secured Silicon Sector can be factory protected depending on version ordered.)*

3. *D_{IN} or D_{OUT} as required by command sequence, data polling, or sector protect algorithm.*

7.2   Word/Byte Configuration

The BYTE# pin controls whether the device data I/O pins operate in the byte or word configuration. If the BYTE# pin is set at logic '1', the device is in word con-figuration, DQ0-DQ15 are active and controlled by CE# and OE#.

If the BYTE# pin is set at logic '0', the device is in byte configuration, and only data I/O pins DQ0-DQ7 are active and controlled by CE# and OE#. The data I/O pins DQ8-DQ14 are tri-stated, and the DQ15 pin is used as an input for the LSB (A-1) address function.

7.3   VersatileIO™ (V_{IO}) Control

The VersatileIO™ (V_{IO}) control allows the host system to set the voltage levels that the device generates and tolerates on CE# and DQ I/Os to the same voltage level that is asserted on V_{IO}. See Ordering Information for V_{IO} options on this device.

For example, a V_{IO} of 1.65-3.6 volts allows for I/O at the 1.8 or 3 volt levels, driving and receiving signals to and from other 1.8 or 3 V devices on the same data bus.

7.4   Read

All memories require access time to output array data. In a read operation, data is read from one memory location at a time. Addresses are presented to the device in random order, and the propagation delay through the device causes the data on its outputs to arrive with the address on its inputs.

The device defaults to reading array data after device power-up or hardware re-set. To read data from the memory array, the system must first assert a valid address on Amax-A0, while driving OE# and CE# to V_{IL}. WE# must remain at V_{IH}. All addresses are latched on the falling edge of CE#. Data will appear on DQ15-DQ0 after ad-dress access time (t_{ACC}), which is equal to the delay from stable addresses to valid output data. The OE# signal must be driven to V_{IL}. Data is output on DQ15-DQ0 pins after the access time (t_{OE}) has elapsed from the falling edge of OE#.

7.5   Page Read Mode

The device is capable of fast page mode read and is compatible with the page mode Mask ROM read operation. This mode provides faster read access speed for random locations within a page. The page size of the device is 8 words/16 bytes. The appropriate page is selected by the higher address bits A(max)-A3. Address bits A2-A0 in word mode (A2-A-1 in byte mode) determine the specific word within a page. The microprocessor supplies the specific word location.

The random or initial page access is equal to t_{ACC} or t_{CE} and subsequent page read accesses (as long as the locations specified by the microprocessor falls within that page) is equivalent to t_{PACC}. When CE# is de-asserted and reasserted for a subsequent access, the access time is t_{ACC} or t_{CE}. Fast page mode accesses are obtained by keeping the "read-page addresses" constant and changing the "intra-read page" addresses.

7.6   Autoselect

The Autoselect mode provides manufacturer and device identification, and sector protection verification, through identifier codes output from the internal register (separate from the memory array) on DQ7-DQ0. This mode is primarily intended for programming equipment to automatically match a device to be programmed with its corresponding programming algorithm (see Table 7.3). The Autoselect codes can also be accessed in-system.

When verifying sector protection, the sector address must appear on the appropriate highest order address bits (see Table 7.4 to Table 7.5). The remaining address bits are don't care. When all necessary bits have been set as required, the programming equipment may then read the corresponding identifier code on DQ15-DQ0. The Autoselect codes can also be accessed in-system through the command register.

There are two methods to access autoselect codes. One uses the autoselect command, the other applies V_{ID} on address pin A9.

When using programming equipment, the autoselect mode requires V_{ID} (11.5 V to 12.5 V) on address pin A9. Address pins must be as shown in Table 7.2.

■ To access the Autoselect codes, the host system must issue the Autoselect command.

■ The Autoselect command sequence may be written to an address within a sector that is either in the read or erase-suspend-read mode.

■ The Autoselect command may not be written while the device is actively programming or erasing.

■ The system must write the reset command to return to the read mode (or erase-suspend-read mode if the sector was previously in Erase Suspend).

■ See Table 12.1 on page 61 for command sequence details.

Table 7.2 Autoselect Codes, (High Voltage Method)

Table 7.4 Autoselect Entry in System
(LLD Function = lld_AutoselectEntryCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	BasexAAAh	Basex555h	0x00AAh
Unlock Cycle 2	Write	Basex555h	Basex2AAh	0x0055h
Autoselect Command	Write	BasexAAAh	Basex555h	0x0090h

Software Functions and Sample Code

Table 7.5 Autoselect Exit
(LLD Function = lld_AutoselectExitCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	base + XXXh	base + XXXh	0x00F0h

Note

1. Any offset within the device works.

2. base = base address.

The following is a C source code example of using the autoselect function to read the manufacturer ID. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Here is an example of Autoselect mode (getting manufacturer ID) */
/* Define UINT16 example: typedef unsigned short UINT16; */

UINT16 manuf_id;

/* Auto Select Entry */

*( (UINT16 *)base_addr + 0x555 ) = 0x00AA; /* write unlock cycle 1 */
*( (UINT16 *)base_addr + 0x2AA ) = 0x0055; /* write unlock cycle 2 */
*( (UINT16 *)base_addr + 0x555 ) = 0x0090; /* write autoselect command */

/* multiple reads can be performed after entry */

manuf_id = *( (UINT16 *)base_addr + 0x000 ); /* read manuf. id */

/*  Autoselect exit */

*( (UINT16 *)base_addr + 0x000 ) = 0x00F0; /* exit autoselect (write reset command) */
```

7.7 Program/Erase Operations

These devices are capable of several modes of programming and or erase operations which are described in detail in the following sections.

During a write operation, the system must drive CE# and WE# to V_{IL} and OE# to VIH when providing an address, command, and data. Addresses are latched on the last falling edge of WE# or CE#, while data is latched on the 1st rising edge of WE# or CE#.

The Unlock Bypass feature allows the host system to send program commands to the Flash device without first writing unlock cycles within the command sequence. See Section 7.7.8 for details on the Unlock Bypass function.

Note the following:

■ When the Embedded Program algorithm is complete, the device returns to the read mode.

■ The system can determine the status of the program operation by using DQ7 or DQ6. Refer to the Write Operation Stat section for information on these status bits.

■ An "0" cannot be programmed back to a "1." A succeeding read shows that the data is still "0."

■ Only erase operations can convert a "0" to a "1."

■ Any commands written to the device during the Embedded Program Algorithm are ignored except the Program Suspend command.

■ Secured Silicon Sector, Autoselect, and CFI functions are unavailable when a program operation is in progress.

■ A hardware reset immediately terminates the program operation and the program command sequence should be reinitiated once the device has returned to the read mode, to ensure data integrity.

■ Programming is allowed in any sequence and across sector boundaries for single word programming operation.

■ Programming to the same word address multiple times without intervening erases is permitted.

7.7.1 Single Word Programming

Single word programming mode is one method of programming the Flash. In this mode, four Flash command write cycles are used to program an individual Flash address. The data for this programming operation could be 8 or 16-bits wide.

While the single word programming method is supported by all Spansion devices, in general it is not recommended for devices that support Write Buffer Programming. See Table 12.1 on page 61 for the required bus cycles and Figure 7.1 for the flowchart.

When the Embedded Program algorithm is complete, the device then returns to the read mode and addresses are no longer latched. The system can determine the status of the program operation by using DQ7 or DQ6. Refer to the Write Operation Status section for information on these status bits.

■ During programming, any command (except the Suspend Program command) is ignored.

■ The Secured Silicon Sector, Autoselect, and CFI functions are unavailable when a program operation is in progress.

■ A hardware reset immediately terminates the program operation. The program command sequence should be reinitiated once the device has returned to the read mode, to ensure data integrity.

■ Programming to the same address multiple times continuously (for example, "walking" a bit within a word) is permitted.

Figure 7.1 Single Word Program
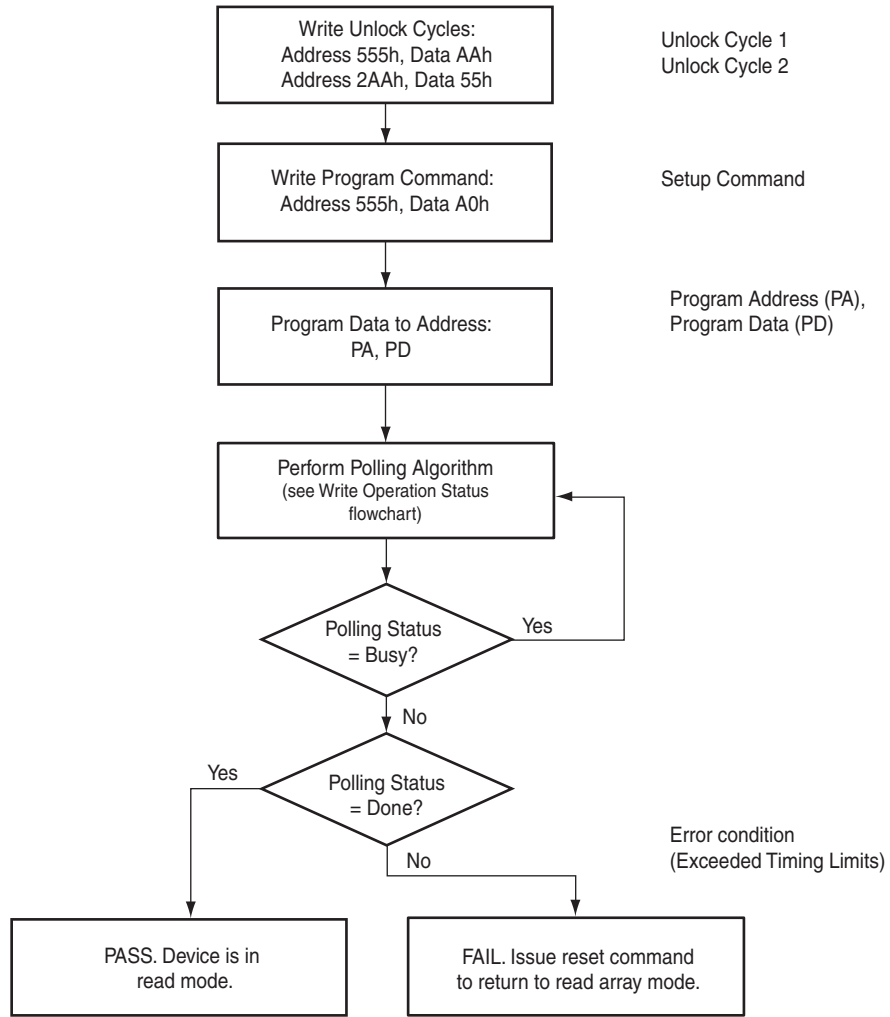

Software Functions and Sample Code

Table 7.6 Single Word/Byte Program
(LLD Function = lld_ProgramCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	Base + AAAh	Base + 555h	00AAh
Unlock Cycle 2	Write	Base + 555h	Base + 2AAh	0055h
Program Setup	Write	Base + AAAh	Base + 555h	00A0h
Program	Write	Byte Address	Word Address	Data

Note
Base = Base Address.

The following is a C source code example of using the single word program function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Program Command   */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1         */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2         */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00A0;   /* write program setup command  */
  *( (UINT16 *)pa )                = data;     /* write data to be programmed  */
/* Poll for program completion */
```

7.7.2   Write Buffer Programming

Write Buffer Programming allows the system to write a maximum of 32 words in one programming operation. This results in a faster effective word programming time than the standard "word" programming algorithms. The Write Buffer Programming command sequence is initiated by first writing two unlock cycles. This is followed by a third write cycle containing the Write Buffer Load command written at the Sector Address in which programming occurs. At this point, the system writes the number of "word locations minus 1" that are loaded into the page buffer at the Sector Address in which programming occurs. This tells the device how many write buffer addresses are loaded with data and therefore when to expect the "Program Buffer to Flash" confirm command. The number of locations to program cannot exceed the size of the write buffer or the operation aborts. (Number loaded = the number of locations to program minus 1. For example, if the system programs 6 address locations, then 05h should be written to the device.)

The system then writes the starting address/data combination. This starting address is the first address/data pair to be programmed, and selects the "write-buffer-page" address. All subsequent address/data pairs must fall within the elected-write-buffer-page.

The "write-buffer-page" is selected by using the addresses A_{MAX}–A5.

The "write-buffer-page" addresses must be the same for all address/data pairs loaded into the write buffer. (This means Write Buffer Programming cannot be performed across multiple "write-buffer-pages." This also means that Write Buffer Programming cannot be performed across multiple sectors. If the system attempts to load programming data outside of the selected "write-buffer-page", the operation ABORTs.)

After writing the Starting Address/Data pair, the system then writes the remaining address/data pairs into the write buffer.

Note that if a Write Buffer address location is loaded multiple times, the "address/data pair" counter is decremented for every data load operation. Also, the last data loaded at a location before the "Program Buffer to Flash" confirm command is programmed into the device. It is the software's responsibility to comprehend ramifications of loading a write-buffer location more than once. The counter decrements for each data load operation, NOT for each unique write-buffer-address location. Once the specified number of write buffer locations have been loaded, the system must then write the "Program Buffer to Flash" command at the Sector Address. Any other address/data write combinations abort the Write Buffer Programming operation. The device goes "busy." The Data Bar polling techniques should be used while monitoring the last address location loaded into the write buffer. This eliminates the need to store an address in memory because the system can load the last address location, issue the program confirm command at the last loaded address location, and then data bar poll at that same address. DQ7, DQ6, DQ5, DQ2, and DQ1 should be monitored to determine the device status during Write Buffer Programming.

The write-buffer "embedded" programming operation can be suspended using the standard suspend/resume commands. Upon successful completion of the Write Buffer Programming operation, the device returns to READ mode.

The Write Buffer Programming Sequence is ABORTED under any of the following conditions:

- Load a value that is greater than the page buffer size during the "Number of Locations to Program" step.

- Write to an address in a sector different than the one specified during the Write-Buffer-Load command.

- Write an Address/Data pair to a different write-buffer-page than the one selected by the "Starting Address" during the "write buffer data loading" stage of the operation.

- Write data other than the "Confirm Command" after the specified number of "data load" cycles.

The ABORT condition is indicated by DQ1 = 1, DQ7 = DATA# (for the "last address location loaded"), DQ6 = TOGGLE, DQ5 = 0. This indicates that the Write Buffer Programming Operation was ABORTED. A "Write-to-Buffer-Abort reset" command sequence is required when using the write buffer Programming features in Unlock Bypass mode. Note that the Secured Silicon sector, autoselect, and CFI functions are unavailable when a program operation is in progress.

Write buffer programming is allowed in any sequence of memory (or address) locations. These flash devices are capable of handling multiple write buffer programming operations on the same write buffer address range without intervening erases.

Use of the write buffer is strongly recommended for programming when multiple words are to be programmed.

Software Functions and Sample Code

Table 7.7 Write Buffer Program
(LLD Functions Used = lld_WriteToBufferCmd, lld_ProgramBufferToFlashCmd)

Cycle	Description	Operation	Byte Address	Word Address	Data
1	Unlock	Write	Base + AAAh	Base + 555h	00AAh
2	Unlock	Write	Base + 555h	Base + 2AAh	0055h
3	Write Buffer Load Command	Write	Sector Address		0025h
4	Write Word Count	Write	Sector Address		Word Count (N–1)h
Number of words (N) loaded into the write buffer can be from 1 to 32 words (1 to 64 bytes).					
5 to 36	Load Buffer Word N	Write	Program Address, Word N		Word N
Last	Write Buffer to Flash	Write	Sector Address		0029h

Notes

1. *Base = Base Address.*

2. *Last = Last cycle of write buffer program operation; depending on number of words written, the total number of cycles may be from 6 to 37.*

3. *For maximum efficiency, it is recommended that the write buffer be loaded with the highest number of words (N words) possible.*

The following is a C source code example of using the write buffer program function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Write Buffer Programming Command       */
/* NOTES: Write buffer programming limited to 16 words. */
/*       All addresses to be written to the flash in   */
/*       one operation must be within the same flash   */
/*       page. A flash page begins at addresses        */
/*       evenly divisible by 0x20.                      */
  UINT16 *src = source_of_data;               /* address of source data          */
  UINT16 *dst = destination_of_data;          /* flash destination address       */
  UINT16 wc  = words_to_program -1;           /* word count (minus 1)            */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;  /* write unlock cycle 1            */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;  /* write unlock cycle 2            */
  *( (UINT16 *)sector_address )    = 0x0025;  /* write write buffer load command */
  *( (UINT16 *)sector_address )    = wc;      /* write word count (minus 1)      */
loop:
  *dst = *src; /* ALL dst MUST BE SAME PAGE */ /* write source data to destination */
  dst++;                                      /* increment destination pointer   */
  src++;                                      /* increment source pointer        */
  if (wc == 0) goto confirm                   /* done when word count equals zero */
  wc--;                                       /* decrement word count            */
  goto loop;                                  /* do it again                     */
confirm:
  *( (UINT16 *)sector_address )    = 0x0029;  /* write confirm command           */
  /* poll for completion */

/* Example: Write Buffer Abort Reset */
  *( (UINT16 *)addr + 0x555 ) = 0x00AA;  /* write unlock cycle 1           */
  *( (UINT16 *)addr + 0x2AA ) = 0x0055;  /* write unlock cycle 2           */
  *( (UINT16 *)addr + 0x555 ) = 0x00F0;  /* write buffer abort reset       */
```

Figure 7.2 Write Buffer Programming Operation
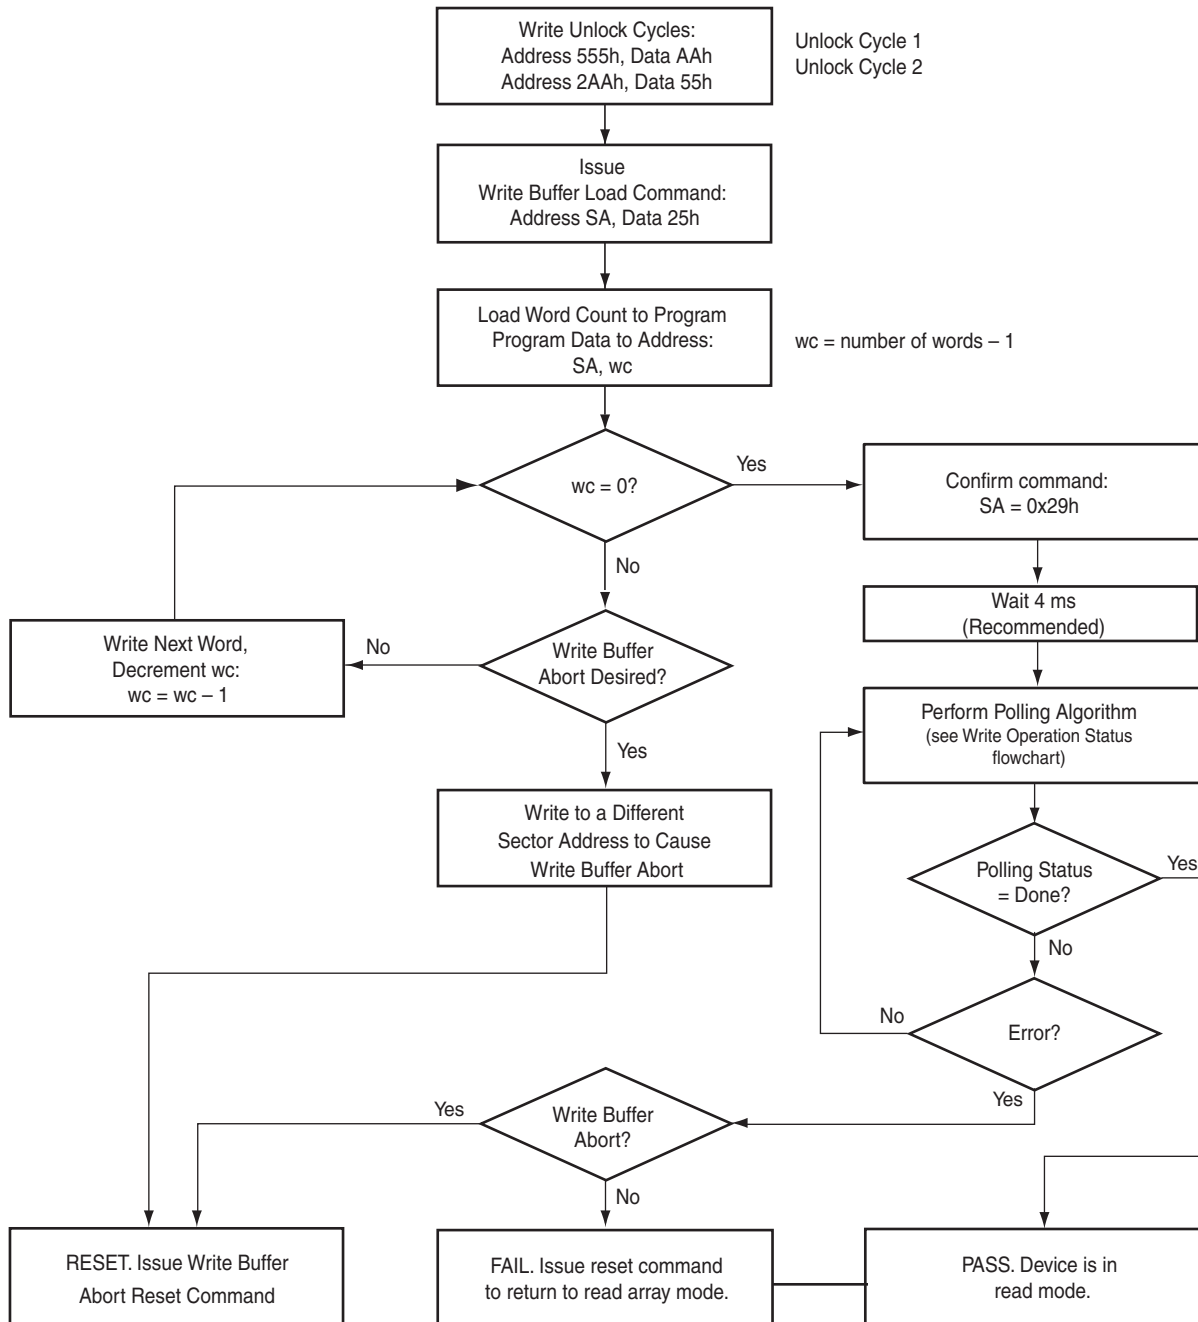

7.7.3 Sector Erase

The sector erase function erases one or more sectors in the memory array. (See Table 12.1 on page 61 and Figure 7.3.) The device does not require the system to preprogram prior to erase. The Embedded Erase algorithm automatically programs and verifies the entire memory for an all zero data pattern prior to electrical erase. After a successful sector erase, all locations within the erased sector contain FFFFh. The system is not required to provide any controls or timings during these operations.

After the command sequence is written, a sector erase time-out of no less than 50 µs occurs. During the time-out period, additional sector addresses and sector erase commands may be written. Loading the sector erase buffer may be done in any sequence, and the number of sectors may be from one sector to all sectors. The time between these additional cycles must be less than 50 µs. Any sector erase address and command following the exceeded time-out (50µs) may or may not be accepted. Any command other than Sector Erase or Erase Suspend during the time-out period resets that sector to the read mode. The system can monitor DQ3 to determine if the sector erase timer has timed out (See Section 7.8.6.) The time-out begins from the rising edge of the final WE# pulse in the command sequence.

When the Embedded Erase algorithm is complete, the sector returns to reading array data and addresses are no longer latched. The system can determine the status of the erase operation by reading DQ7 or DQ6/DQ2 in the erasing sector. Refer to Section 7.8 for information on these status bits.

Once the sector erase operation has begun, only the Erase Suspend command is valid. All other commands are ignored. However, note that a hardware reset immediately terminates the erase operation. If that occurs, the sector erase command sequence should be reinitiated once that sector has returned to reading array data, to ensure the sector is properly erased.

The Unlock Bypass feature allows the host system to send program commands to the Flash device without first writing unlock cycles within the command sequence. See Section 7.7.8 for details on the Unlock Bypass function.

Figure 7.3 illustrates the algorithm for the erase operation. Refer to Section 11.7.5 for parameters and timing diagrams.

Software Functions and Sample Code

Table 7.8 Sector Erase
(LLD Function = lld_SectorEraseCmd)

Cycle	Description	Operation	Byte Address	Word Address	Data
1	Unlock	Write	Base + AAAh	Base + 555h	00AAh
2	Unlock	Write	Base + 555h	Base + 2AAh	0055h
3	Setup Command	Write	Base + AAAh	Base + 555h	0080h
4	Unlock	Write	Base + AAAh	Base + 555h	00AAh
5	Unlock	Write	Base + 555h	Base + 2AAh	0055h
6	Sector Erase Command	Write	Sector Address	Sector Address	0030h
Unlimited additional sectors may be selected for erase; command(s) must be written within 50 µs.					

The following is a C source code example of using the sector erase function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Sector Erase Command */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1            */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2            */
  *( (UINT16 *)base_addr + 0x555 ) = 0x0080;   /* write setup command            */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write additional unlock cycle 1 */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write additional unlock cycle 2 */
  *( (UINT16 *)sector_address )    = 0x0030;   /* write sector erase command      */
```

Figure 7.3 Sector Erase Operation

Write Unlock Cycles:
Address 555h, Data AAh — Unlock Cycle 1
Address 2AAh, Data 55h — Unlock Cycle 2

Write Sector Erase Cycles:
Address 555h, Data 80h — Command Cycle 1
Address 555h, Data AAh — Command Cycle 2
Address 2AAh, Data 55h — Command Cycle 3
Sector Address, Data 30h — Specify first sector for erasure

Select Additional Sectors? — No / Yes

Write Additional Sector Addresses

- Each additional cycle must be written within t_{SEA} timeout
- The host system may monitor DQ3 or wait t_{SEA} to ensure acceptance of erase commands
- No limit on number of sectors
- Commands other than Erase Suspend or selecting additional sectors for erasure during timeout reset device to reading array data

Poll DQ3. DQ3 = 1? — No / Yes

Last Sector Selected? — Yes / No

Wait 4 ms (Recommended)

Perform Write Operation Status Algorithm (see Figure 7.4) — Status may be obtained by reading DQ7, DQ6 and/or DQ2.

Done? — Yes / No

DQ5 = 1? — No — Error condition (Exceeded Timing Limits)

Yes

PASS. Device returns to reading array.

FAIL. Write reset command to return to reading array.

Notes

1. See Table 12.1 on page 61 for erase command sequence.

2. See the section on DQ3 for information on the sector erase timeout.

7.7.4 Chip Erase Command Sequence

Chip erase is a six-bus cycle operation as indicated by Table 12.1 on page 61. These commands invoke the Embedded Erase algorithm, which does not require the system to preprogram prior to erase. The Embedded Erase algorithm automatically preprograms and verifies the entire memory for an all zero data pattern prior to electrical erase. After a successful chip erase, all locations of the chip contain FFFFh. The system is not required to provide any controls or timings during these operations. The "Command Definition" section in the appendix shows the address and data requirements for the chip erase command sequence.

When the Embedded Erase algorithm is complete, that sector returns to the read mode and addresses are no longer latched. The system can determine the status of the erase operation by using DQ7 or DQ6/DQ2. Refer to "Write Operation Status" for information on these status bits.

The Unlock Bypass feature allows the host system to send program commands to the Flash device without first writing unlock cycles within the command sequence. See Section 7.7.8 for details on the Unlock Bypass function.

Any commands written during the chip erase operation are ignored. However, note that a hardware reset immediately terminates the erase operation. If that occurs, the chip erase command sequence should be reinitiated once that sector has returned to reading array data, to ensure the entire array is properly erased.

Software Functions and Sample Code

Table 7.9 Chip Erase
(LLD Function = lld_ChipEraseCmd)

| Cycle	Description	Operation	Byte Address	Word Address	Data
1	Unlock	Write	Base + AAAh	Base + 555h	00AAh
2	Unlock	Write	Base + 555h	Base + 2AAh	0055h
3	Setup Command	Write	Base + AAAh	Base + 555h	0080h
4	Unlock	Write	Base + AAAh	Base + 555h	00AAh
5	Unlock	Write	Base + 555h	Base + 2AAh	0055h
6	Chip Erase Command	Write	Base + AAAh	Base + 555h	0010h

The following is a C source code example of using the chip erase function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Chip Erase Command */
/* Note: Cannot be suspended   */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1            */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2            */
  *( (UINT16 *)base_addr + 0x555 ) = 0x0080;   /* write setup command            */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write additional unlock cycle 1 */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write additional unlock cycle 2 */
  *( (UINT16 *)base_addr + 0x000 ) = 0x0010;   /* write chip erase command       */
```

7.7.5   Erase Suspend/Erase Resume Commands

The Erase Suspend command allows the system to interrupt a sector erase operation and then read data from, or program data to, any sector not selected for erasure. The sector address is required when writing this command. This command is valid only during the sector erase operation, including the minimum 50 µs time-out period during the sector erase command sequence. The Erase Suspend command is ignored if written during the chip erase operation.

When the Erase Suspend command is written during the sector erase operation, the device requires a maximum of 20 µs (5 µs typical) to suspend the erase operation. However, when the Erase Suspend command is written during the sector erase time-out, the device immediately terminates the time-out period and suspends the erase operation.

After the erase operation has been suspended, the device enters the erase-suspend-read mode. The system can read data from or program data to any sector not selected for erasure. (The device "erase suspends" all sectors selected for erasure.) Reading at any address within erase-suspended sectors produces status information on DQ7-DQ0. The system can use DQ7, or DQ6, and DQ2 together, to determine if a sector is actively erasing or is erase-suspended. Refer to Table 7.35 for information on these status bits.

After an erase-suspended program operation is complete, the device returns to the erase-suspend-read mode. The system can determine the status of the program operation using the DQ7 or DQ6 status bits, just as in the standard program operation.

In the erase-suspend-read mode, the system can also issue the Autoselect command sequence. Refer to the "Write Buffer Programming Operation" section and the "Autoselect Command Sequence" section for details.

To resume the sector erase operation, the system must write the Erase Resume command. The address of the erase-suspended sector is required when writing this command. Further writes of the Resume command are ignored. Another Erase Suspend command can be written after the chip has resumed erasing.

Software Functions and Sample Code

Table 7.10 Erase Suspend
(LLD Function = lld_EraseSuspendCmd)

Cycle	Operation	Byte Address	Word Address	Data
1	Write	Base + XXXh	Base + XXXh	00B0h

The following is a C source code example of using the erase suspend function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Erase suspend command */
  *( (UINT16 *)base_addr + 0x000 ) = 0x00B0;   /* write suspend command         */
```

Table 7.11 Erase Resume
(LLD Function = lld_EraseResumeCmd)

Cycle	Operation	Byte Address	Word Address	Data
1	Write	Sector Address	Sector Address	0030h

The following is a C source code example of using the erase resume function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Erase resume command */
  *( (UINT16 *)sector_addr + 0x000 ) = 0x0030;   /* write resume command          */
    /* The flash needs adequate time in the resume state */
```

7.7.6 Program Suspend/Program Resume Commands

The Program Suspend command allows the system to interrupt an embedded programming operation or a "Write to Buffer" programming operation so that data can read from any non-suspended sector. When the Program Suspend command is written during a programming process, the device halts the programming operation within 15 µs maximum (5 µs typical) and updates the status bits. Addresses are "don't-cares" when writing the Program Suspend command.

After the programming operation has been suspended, the system can read array data from any non-suspended sector. The Program Suspend command may also be issued during a programming operation while an erase is suspended. In this case, data may be read from any addresses not in Erase Suspend or Program Suspend. If a read is needed from the Secured Silicon Sector area, then user must use the proper command sequences to enter and exit this region.

The system may also write the Autoselect command sequence when the device is in Program Suspend mode. The device allows reading Autoselect codes in the suspended sectors, since the codes are not stored in the memory array. When the device exits the Autoselect mode, the device reverts to Program Suspend mode, and is ready for another valid operation. See "Autoselect Command Sequence" for more information.

After the Program Resume command is written, the device reverts to programming. The system can determine the status of the program operation using the DQ7 or DQ6 status bits, just as in the standard program operation. See "Write Operation Status" for more information.

The system must write the Program Resume command (address bits are "don't care") to exit the Program Suspend mode and continue the programming operation. Further writes of the Program Resume command are ignored. Another Program Suspend command can be written after the device has resumed programming.

Software Functions and Sample Code

Table 7.12 Program Suspend
(LLD Function = lld_ProgramSuspendCmd)

Cycle	Operation	Word Address	Data
1	Write	Base + XXXh	00B0h

The following is a C source code example of using the program suspend function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Program suspend command */
  *( (UINT16 *)base_addr + 0x000 ) = 0x00B0;   /* write suspend command         */
```

Table 7.13 Program Resume
(LLD Function = lld_ProgramResumeCmd)

Cycle	Operation	Word Address	Data
1	Write	Base + XXXh	0030h

The following is a C source code example of using the program resume function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Program resume command */
  *( (UINT16 *)base_addr + 0x000 ) = 0x0030;   /* write resume command          */
```

7.7.7 Accelerated Program

Accelerated single word programming and write buffer programming operations are enabled through the WP#/ACC pin. This method is faster than the standard program command sequences.

Note

The accelerated program functions must not be used more than 10 times per sector.

If the system asserts V_{HH} on this input, the device automatically enters the aforementioned Unlock Bypass mode and uses the higher voltage on the input to reduce the time required for program operations. The system can then use the Write Buffer Load command sequence provided by the Unlock Bypass mode. Note that if a "Write-to-Buffer-Abort Reset" is required while in Unlock Bypass mode, the full 3-cycle RESET command sequence must be used to reset the device. Removing V_{HH} from the ACC input, upon completion of the embedded program operation, returns the device to normal operation.

- Sectors must be unlocked prior to raising WP#/ACC to V_{HH}.

- The WP#/ACC pin must not be at V_{HH} for operations other than accelerated programming, or device damage may result.

- The WP#/ACC pin must not be left floating or unconnected; inconsistent behavior of the device may result.

7.7.8 Unlock Bypass

The device features an Unlock Bypass mode to facilitate faster word programming. Once the device enters the Unlock Bypass mode, only two write cycles are required to program data, instead of the normal four cycles.

This mode dispenses with the initial two unlock cycles required in the standard program command sequence, resulting in faster total programming time. The "Command Definition Summary" section shows the requirements for the unlock bypass command sequences.

During the unlock bypass mode, only the Read, Unlock Bypass Program and Unlock Bypass Reset commands are valid. To exit the unlock bypass mode, the system must issue the two-cycle unlock bypass reset command sequence. The first cycle must contain the sector address and the data 90h. The second cycle need only contain the data 00h. The sector then returns to the read mode.

Software Functions and Sample Code

The following are C source code examples of using the unlock bypass entry, program, and exit functions. Refer to the *Spansion Low Level Driver User's Guide* (available soon on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

Table 7.14 Unlock Bypass Entry
(LLD Function = lld_UnlockBypassEntryCmd)

Cycle	Description	Operation	Word Address	Data
1	Unlock	Write	Base + 555h	00AAh
2	Unlock	Write	Base + 2AAh	0055h
3	Entry Command	Write	Base + 555h	0020h

```
/* Example: Unlock Bypass Entry Command    */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1          */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2          */
  *( (UINT16 *)base_addr + 0x555 ) = 0x0020;   /* write unlock bypass command   */
   /* At this point, programming only takes two write cycles.  */
   /* Once you enter Unlock Bypass Mode, do a series of like   */
   /* operations (programming or sector erase) and then exit   */
   /* Unlock Bypass Mode before beginning a different type of  */
   /* operations.                                              */
```

Table 7.15 Unlock Bypass Program
(LLD Function = lld_UnlockBypassProgramCmd)

Cycle	Description	Operation	Word Address	Data
1	Program Setup Command	Write	Base +xxxh	00A0h
2	Program Command	Write	Program Address	Program Data

```
/* Example: Unlock Bypass Program Command  */
/* Do while in Unlock Bypass Entry Mode!   */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00A0;   /* write program setup command    */
  *( (UINT16 *)pa )               = data;      /* write data to be programmed    */
  /* Poll until done or error.    */
  /* If done and more to program, */
  /* do above two cycles again.   */
```

Table 7.16 Unlock Bypass Reset
(LLD Function = lld_UnlockBypassResetCmd)

Cycle	Description	Operation	Word Address	Data
1	Reset Cycle 1	Write	Base +xxxh	0090h
2	Reset Cycle 2	Write	Base +xxxh	0000h

```
/* Example: Unlock Bypass Exit Command */
  *( (UINT16 *)base_addr + 0x000 ) = 0x0090;
  *( (UINT16 *)base_addr + 0x000 ) = 0x0000;
```

7.8   Write Operation Status

The device provides several bits to determine the status of a program or erase operation. The following subsections describe the function of DQ1, DQ2, DQ3, DQ5, DQ6, and DQ7.

7.8.1   DQ7: Data# Polling

The Data# Polling bit, DQ7, indicates to the host system whether an Embedded Program or Erase algorithm is in progress or completed, or whether the device is in Erase Suspend. Data# Polling is valid after the rising edge of the final WE# pulse in the command sequence. Note that the Data# Polling is valid only for the last word being programmed in the write-buffer-page during Write Buffer Programming. Reading Data# Polling status on any word other than the last word to be programmed in the write-buffer-page returns false status information.

During the Embedded Program algorithm, the device outputs on DQ7 the complement of the datum programmed to DQ7. This DQ7 status also applies to programming during Erase Suspend. When the Embedded Program algorithm is complete, the device outputs the datum programmed to DQ7. The system must provide the program address to read valid status information on DQ7. If a program address falls within a protected sector, Data# polling on DQ7 is active for approximately 1 µs, then that sector returns to the read mode.

During the Embedded Erase Algorithm, Data# polling produces a "0" on DQ7. When the Embedded Erase algorithm is complete, or if the device enters the Erase Suspend mode, Data# Polling produces a "1" on DQ7. The system must provide an address within any of the sectors selected for erasure to read valid status information on DQ7.

After an erase command sequence is written, if all sectors selected for erasing are protected, Data# Polling on DQ7 is active for approximately 100 µs, then the device returns to the read mode. If not all selected sectors are protected, the Embedded Erase algorithm erases the unprotected sectors, and ignores the selected sectors that are protected. However, if the system reads DQ7 at an address within a protected sector, the status may not be valid.

Just prior to the completion of an Embedded Program or Erase operation, DQ7 may change with DQ6-DQ0 while Output Enable (OE#) is asserted low. That is, the device may change from providing status information

to valid data on DQ7. Depending on when the system samples the DQ7 output, it may read the status or valid data. Even if the device has completed the program or erase operation and DQ7 has valid data, the data outputs on DQ6-DQ0 may be still invalid. Valid data on DQ7-D00 appears on successive read cycles.

See the following for more information: Table 7.17, shows the outputs for Data# Polling on DQ7. Figure 7.4, shows the Data# Polling algorithm; and Figure 11.7, shows the Data# Polling timing diagram.

Figure 7.4 Write Operation Status Flowchart
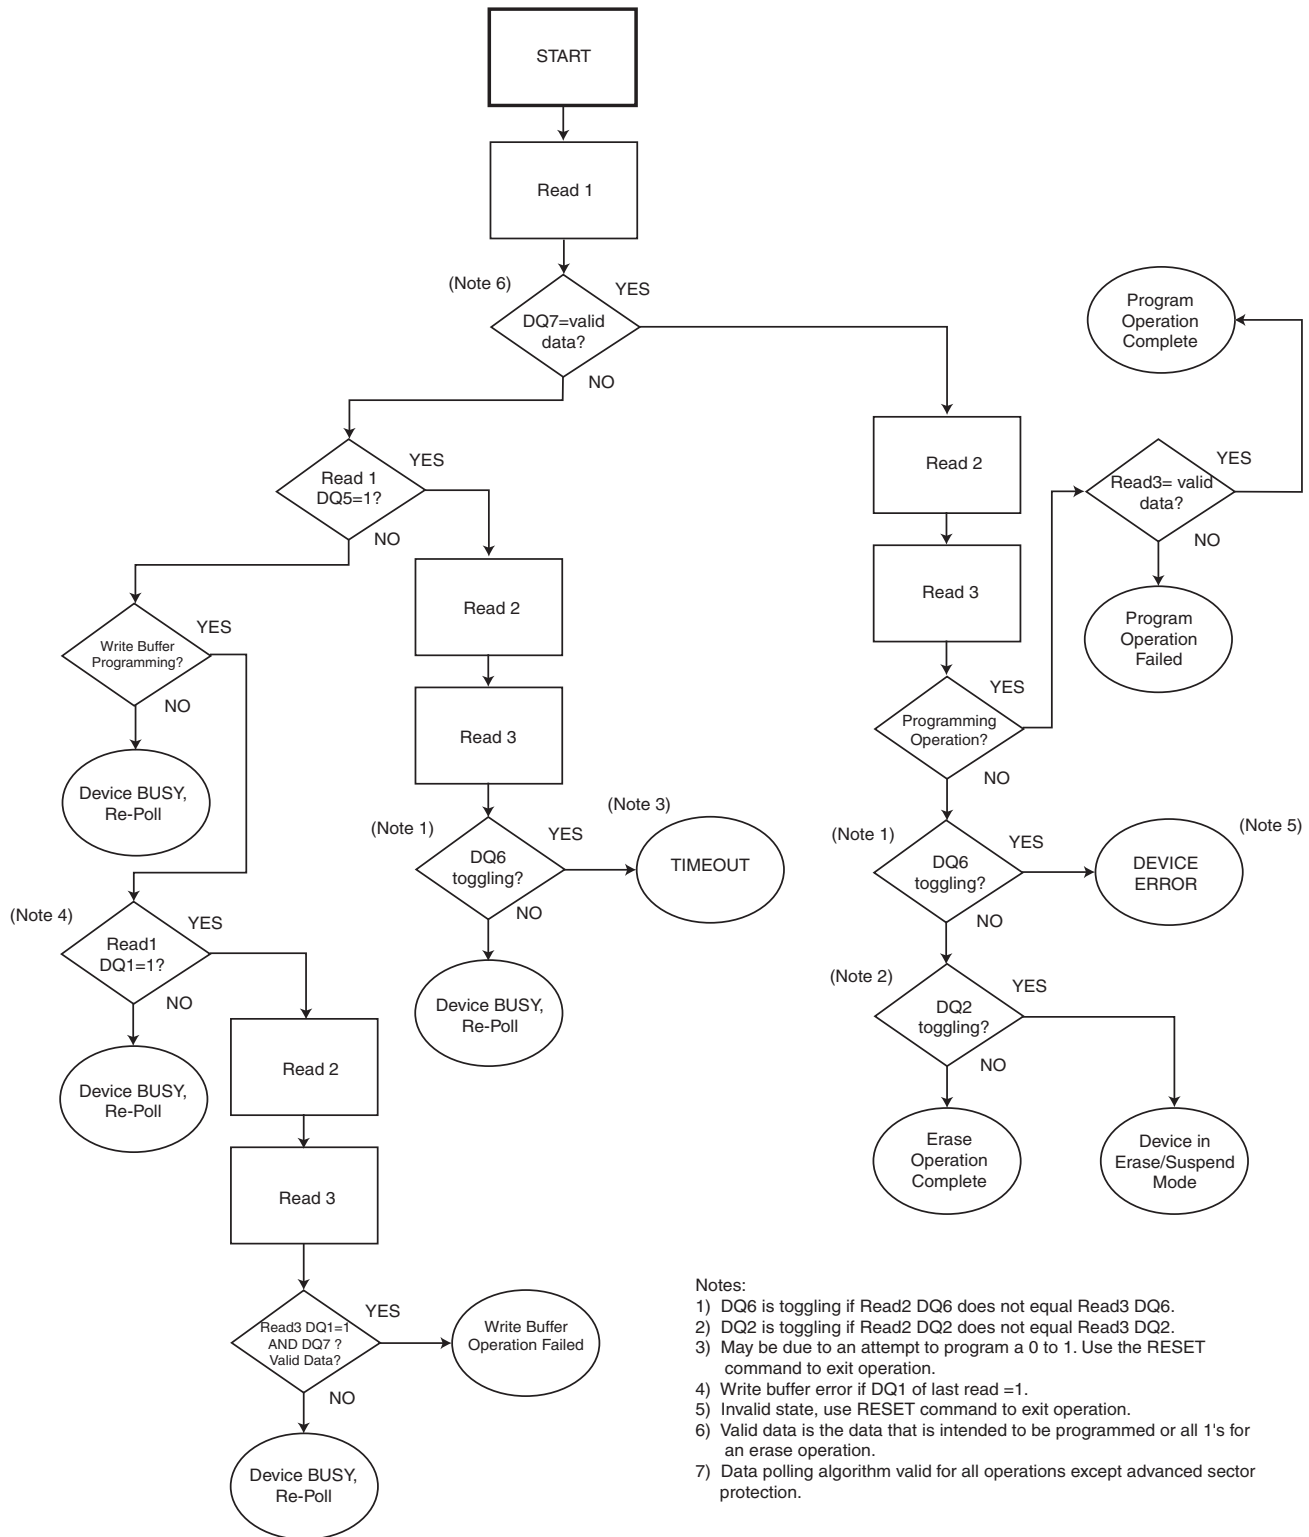

Notes:
1) DQ6 is toggling if Read2 DQ6 does not equal Read3 DQ6.
2) DQ2 is toggling if Read2 DQ2 does not equal Read3 DQ2.
3) May be due to an attempt to program a 0 to 1. Use the RESET command to exit operation.
4) Write buffer error if DQ1 of last read =1.
5) Invalid state, use RESET command to exit operation.
6) Valid data is the data that is intended to be programmed or all 1's for an erase operation.
7) Data polling algorithm valid for all operations except advanced sector protection.

7.8.2   DQ6: Toggle Bit I

Toggle Bit I on DQ6 indicates whether an Embedded Program or Erase algorithm is in progress or complete, or whether the device has entered the Erase Suspend mode. Toggle Bit I may be read at any address, and is valid after the rising edge of the final WE# pulse in the command sequence (prior to the program or erase operation), and during the sector erase time-out.

During an Embedded Program or Erase algorithm operation, successive read cycles to any address cause DQ6 to toggle. When the operation is complete, DQ6 stops toggling.

After an erase command sequence is written, if all sectors selected for erasing are protected, DQ6 toggles for approximately 100μs, then returns to reading array data. If not all selected sectors are protected, the Embedded Erase algorithm erases the unprotected sectors, and ignores the selected sectors that are protected.

The system can use DQ6 and DQ2 together to determine whether a sector is actively erasing or is erase-suspended. When the device is actively erasing (that is, the Embedded Erase algorithm is in progress), DQ6 toggles. When the device enters the Erase Suspend mode, DQ6 stops toggling. However, the system must also use DQ2 to determine which sectors are erasing or erase-suspended. Alternatively, the system can use DQ7 (see the subsection on DQ7: Data# Polling).

If a program address falls within a protected sector, DQ6 toggles for approximately 1μs after the program command sequence is written, then returns to reading array data.

DQ6 also toggles during the erase-suspend-program mode, and stops toggling once the Embedded Program Algorithm is complete.

See the following for additional information: Figure 7.4, Figure 11.13 on page 57, and Table 7.17.

Toggle Bit I on DQ6 requires either OE# or CE# to be de-asserted and reasserted to show the change in state.

7.8.3   DQ2: Toggle Bit II

The "Toggle Bit II" on DQ2, when used with DQ6, indicates whether a particular sector is actively erasing (that is, the Embedded Erase algorithm is in progress), or whether that sector is erase-suspended. Toggle Bit II is valid after the rising edge of the final WE# pulse in the command sequence. DQ2 toggles when the system reads at addresses within those sectors that have been selected for erasure. But DQ2 cannot distinguish whether the sector is actively erasing or is erase-suspended. DQ6, by comparison, indicates whether the device is actively erasing, or is in Erase Suspend, but cannot distinguish which sectors are selected for erasure. Thus, both status bits are required for sector and mode information. Refer to Table 7.17 to compare outputs for DQ2 and DQ6. See Figure 11.14 on page 57 for additional information.

7.8.4   Reading Toggle Bits DQ6/DQ2

Whenever the system initially begins reading toggle bit status, it must read DQ7–DQ0 at least twice in a row to determine whether a toggle bit is toggling. Typically, the system would note and store the value of the toggle bit after the first read. After the second read, the system would compare the new value of the toggle bit with the first. If the toggle bit is not toggling, the device has completed the program or erases operation. The system can read array data on DQ7–DQ0 on the following read cycle. However, if after the initial two read cycles, the system determines that the toggle bit is still toggling, the system also should note whether the value of DQ5 is high (see the section on DQ5). If it is, the system should then determine again whether the toggle bit is toggling, since the toggle bit may have stopped toggling just as DQ5 went high. If the toggle bit is no longer toggling, the device has successfully completed the program or erases operation. If it is still toggling, the device did not complete the operation successfully, and the system must write the reset command to return to reading array data. The remaining scenario is that the system initially determines that the toggle bit is toggling and DQ5 has not gone high. The system may continue to monitor the toggle bit and DQ5 through successive read cycles, determining the status as described in the previous paragraph. Alternatively, it may choose to perform other system tasks. In this case, the system must start at the beginning of the algorithm when it returns to determine the status of the operation. Refer to Figure 7.4 for more details.

Note

When verifying the status of a write operation (embedded program/erase) of a memory sector, DQ6 and DQ2 toggle between high and low states in a series of consecutive and con-tiguous status read cycles. In order for

this toggling behavior to be properly observed, the consecutive status bit reads must not be interleaved with read accesses to other memory sectors. If it is not possible to temporarily prevent reads to other memory sectors, then it is recommended to use the DQ7 status bit as the alternative method of determining the active or inactive status of the write operation.

7.8.5   DQ5: Exceeded Timing Limits

DQ5 indicates whether the program or erase time has exceeded a specified internal pulse count limit. Under these conditions DQ5 produces a "1," indicating that the program or erase cycle was not successfully completed. The system must write the reset command to return to the read mode (or to the erase-suspend-read mode if a sector was previously in the erase-suspend-program mode).

7.8.6   DQ3: Sector Erase Timeout State Indicator

After writing a sector erase command sequence, the system may read DQ3 to determine whether or not erasure has begun. (The sector erase timer does not apply to the chip erase command.) If additional sectors are selected for erasure, the entire time-out also applies after each additional sector erase command. When the time-out period is complete, DQ3 switches from a "0" to a "1." If the time between additional sector erase commands from the system can be assumed to be less than 50 μs, then the system need not monitor DQ3. See Sector Erase Command Sequence for more details.

After the sector erase command is written, the system should read the status of DQ7 (Data# Polling) or DQ6 (Toggle Bit I) to ensure that the device has accepted the command sequence, and then read DQ3. If DQ3 is "1," the Embedded Erase algorithm has begun; all further commands (except Erase Suspend) are ignored until the erase operation is complete. If DQ3 is "0," the device accepts additional sector erase commands. To ensure the command has been accepted, the system software should check the status of DQ3 prior to and following each sub-sequent sector erase command. If DQ3 is high on the second status check, the last command might not have been accepted. Table 7.17 shows the status of DQ3 relative to the other status bits.

7.8.7   DQ1: Write to Buffer Abort

DQ1 indicates whether a Write to Buffer operation was aborted. Under these conditions DQ1 produces a "1". The system must issue the Write to Buffer Abort Reset command sequence to return the device to reading array data. See Write Buffer Programming Operation for more details.

Table 7.17 Write Operation Status

Status		DQ7 (Note 2)	DQ6	DQ5 (Note 1)	DQ3	DQ2 (Note 2)	DQ1	RY/BY#
Standard Mode	Embedded Program Algorithm	DQ7#	Toggle	0	N/A	No toggle	0	0
	Embedded Erase Algorithm	0	Toggle	0	1	Toggle	N/A	0
Program Suspend Mode	Program-Suspend Read — Program-Suspended Sector	Invalid (not allowed)						1
	Program-Suspend Read — Non-Program Suspended Sector	Data						1
Erase Suspend Mode	Erase-Suspend Read — Erase-Suspended Sector	1	No toggle	0	N/A	Toggle	N/A	1
	Erase-Suspend Read — Non-Erase Suspended Sector	Data						1
	Erase-Suspend-Program (Embedded Program)	DQ7#	Toggle	0	N/A	N/A	N/A	0
Write-to-Buffer	Busy (Note 3)	DQ7#	Toggle	0	N/A	N/A	0	0
	Abort (Note 4)	DQ7#	Toggle	0	N/A	N/A	1	0

Notes

1. *DQ5 switches to* 1 *when an Embedded Program, Embedded Erase, or Write-to-Buffer operation has exceeded the maximum timing limits. Refer to the section on DQ5 for more information.*

2. *DQ7 and DQ2 require a valid address when reading status information. Refer to the appropriate subsection for further details.*

3. *The Data# Polling algorithm should be used to monitor the last loaded write-buffer address location.*

4. *DQ1 switches to 1 when the device has aborted the write-to-buffer operation*

7.9 Writing Commands/Command Sequences

During a write operation, the system must drive CE# and WE# to V_{IL} and OE# to V_{IH} when providing an address, command, and data. Addresses are latched on the last falling edge of WE# or CE#, while data is latched on the 1st rising edge of WE# or CE#. An erase operation can erase one sector, multiple sectors, or the entire device. Table 6.2–Table 6.3 indicate the address space that each sector occupies. The device address space is divided into uniform 64KW/128KB sectors. A sector address is the set of address bits required to uniquely select a sector. I_{CC2} in "DC Characteristics" represents the active current specification for the write mode. "AC Characteristics" contains timing specification tables and timing diagrams for write operations.

7.9.1 RY/BY#

This feature allows the host system to detect when data is ready to be read by simply monitoring the RY/BY# pin, which is a dedicated output and controlled by CE#.

The device address space is divided into uniform 64KW/128KB sectors. A sector address is the set of address bits required to uniquely select a sector.

7.9.2 Hardware Reset

The RESET# input provides a hardware method of resetting the device to reading array data. When RESET# is driven low for at least a period of t_{RP}, the device immediately terminates any operation in progress, tristates all outputs, resets the configuration register, and ignores all read/write commands for the duration of the RESET# pulse. The device also resets the internal state machine to reading array data.

To ensure data integrity the operation that was interrupted should be reinitiated once the device is ready to accept another command sequence.

When RESET# is held at V_{SS}, the device draws V_{CC} reset current (I_{CC5}). If RESET# is held at V_{IL}, but not at V_{SS}, the standby current is greater. RESET# may be tied to the system reset circuitry which enables the system to read the boot-up firmware from the Flash memory upon a system reset. See Figure 11.7 on page 53 and Figure 11.8 on page 54 for timing diagrams.

Note
Hardware reset operation during embedded erase is not recommended; permanent device damage may result.

7.9.3 Software Reset

Software reset is part of the command set (see Table 12.1 on page 61) that also returns the device to array read mode and must be used for the following conditions:

1. to exit Autoselect mode

2. when DQ5 goes high during write status operation that indicates program or erase cycle was not successfully completed

3. exit sector lock/unlock operation.

4. to return to erase-suspend-read mode if the device was previously in Erase Suspend mode.

5. after any aborted operations

Software Functions and Sample Code

Table 7.18 Reset
(LLD Function = lld_ResetCmd)

Cycle	Operation	Byte Address	Word Address	Data
Reset Command	Write	Base + xxxh	Base + xxxh	00F0h

Note
Base = Base Address.

The following is a C source code example of using the reset function. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: Reset (software reset of Flash state machine) */
   *( (UINT16 *)base_addr + 0x000 ) = 0x00F0;
```

The following are additional points to consider when using the reset command:

■ This command resets the sectors to the read and address bits are ignored.

■ Reset commands are ignored once erasure has begun until the operation is complete.

■ Once programming begins, the device ignores reset commands until the operation is complete

■ The reset command may be written between the cycles in a program command sequence before programming begins (prior to the third cycle). This resets the sector to which the system was writing to the read mode.

■ If the program command sequence is written to a sector that is in the Erase Suspend mode, writing the reset command returns that sector to the erase-suspend-read mode.

■ The reset command may be also written during an Autoselect command sequence.

■ If a sector has entered the Autoselect mode while in the Erase Suspend mode, writing the reset command returns that sector to the erase-suspend-read mode.

■ If DQ1 goes high during a Write Buffer Programming operation, the system must write the "Write to Buffer Abort Reset" command sequence to RESET the device to reading array data. The standard RESET command does not work during this condition.

■ To exit the unlock bypass mode, the system must issue a two-cycle unlock bypass reset command sequence [see command table for details].

8. Advanced Sector Protection/Unprotection

The Advanced Sector Protection/Unprotection feature disables or enables programming or erase operations in any or all sectors and can be implemented through software and/or hardware methods, which are independent of each other. This section describes the various methods of protecting data stored in the memory array. An overview of these methods in shown in Figure 8.1.

Figure 8.1 Advanced Sector Protection/Unprotection

Hardware Methods

WP#/ACC = V_{IL}
(Highest or Lowest Sector Locked)

Software Methods

Lock Register
(One Time Programmable)

Password Method (DQ2) | Persistent Method (DQ1)

64-bit Password
(One Time Protect)

PPB Lock Bit[1,2,3]

0 = PPBs Locked | 1 = PPBs Unlocked

1. Bit is volatile, and defaults to "1" on reset.
2. Programming to "0" locks all PPBs to their current state.
3. Once programmed to "0", requires hardware reset to unlock.

Memory Array | Persistent Protection Bit (PPB)[4,5] | Dynamic Protection Bit (DYB)[6,7,8]

Sector 0 | PPB 0 | DYB 0
Sector 1 | PPB 1 | DYB 1
Sector 2 | PPB 2 | DYB 2
Sector N-2 | PPB N-2 | DYB N-2
Sector N-1 | PPB N-1 | DYB N-1
Sector N[3] | PPB N | DYB N

3. N = Highest Address Sector.

4. 0 = Sector Protected, 1 = Sector Unprotected.
5. PPBs programmed individually, but cleared collectively

6. 0 = Sector Protected, 1 = Sector Unprotected.
7. Protect effective only if PPB Lock Bit is unlocked and corresponding PPB is "1" (unprotected).
8. Volatile Bits: defaults to user choice upon power-up (see ordering options).

8.1 Lock Register

As shipped from the factory, all devices default to the persistent mode when power is applied, and all sectors are unprotected, unless otherwise chosen through the DYB ordering option (see *Ordering Information on page 5*). The device programmer or host system must then choose which sector protection method to use. Programming (setting to "0") any one of the following two one-time programmable, non-volatile bits locks the part permanently in that mode:

- Lock Register Persistent Protection Mode Lock Bit (DQ1)
- Lock Register Password Protection Mode Lock Bit (DQ2)

Table 8.1 Lock Register

DQ15-3	DQ2	DQ1	DQ0
Don't Care	Password Protection Mode Lock Bit	Persistent Protection Mode Lock Bit	Secured Silicon Sector Protection Bit

For programming lock register bits refer to Table 12.2 on page 63 and Table 12.4 on page 65.

Notes

1. If the password mode is chosen, the password must be programmed before setting the corresponding lock register bit.

2. After the Lock Register Bits Command Set Entry command sequence is written, reads and writes for Sector 0 are disabled, while reads from other sectors are allowed until exiting this mode.

3. If both lock bits are selected to be programmed (to zeros) at the same time, the operation aborts.

4. Once the Password Mode Lock Bit is programmed, the Persistent Mode Lock Bit is permanently disabled, and no changes to the protection scheme are allowed. Similarly, if the Persistent Mode Lock Bit is programmed, the Password Mode is permanently disabled.

After selecting a sector protection method, each sector can operate in any of the following three states:

1. *Constantly locked.* The selected sectors are protected and can not be reprogrammed unless PPB lock bit is cleared via a password, hardware reset, or power cycle.

2. *Dynamically locked.* The selected sectors are protected and can be altered via software commands.

3. *Unlocked.* The sectors are unprotected and can be erased and/or programmed.

These states are controlled by the bit types described in Section 8.2–Section 8.5.

8.2 Persistent Protection Bits

The Persistent Protection Bits are unique and nonvolatile for each sector and have the same endurances as the Flash memory. Preprogramming and verification prior to erasure are handled by the device, and therefore do not require system monitoring.

Notes

1. Each PPB is individually programmed and all are erased in parallel.

2. While programming PPB for a sector, array data can be read from any other sector, except Sector 0 (used for Data# Polling) and the sector in which sector PPB is being programmed.

3. Entry command disables reads and writes for the sector selected.

4. Reads within that sector return the PPB status for that sector.

5. All Reads must be performed using the read mode.

6. The specific sector address (A25-A16 GL01GP, A24-A16 GL512P, A23-A16 GL256P, A22-A16 GL128P) are written at the same time as the program command.

7. If the PPB Lock Bit is set, the PPB Program or erase command does not execute and times-out without programming or erasing the PPB.

8. There are no means for individually erasing a specific PPB and no specific sector address is required for this operation.

9. Exit command must be issued after the execution which resets the device to read mode and re-enables reads and writes for Sector 0.

10. The programming state of the PPB for a given sector can be verified by writing a PPB Status Read Command to the device as described by the flow chart shown in Figure 8.2.

Figure 8.2 PPB Program/Erase Algorithm
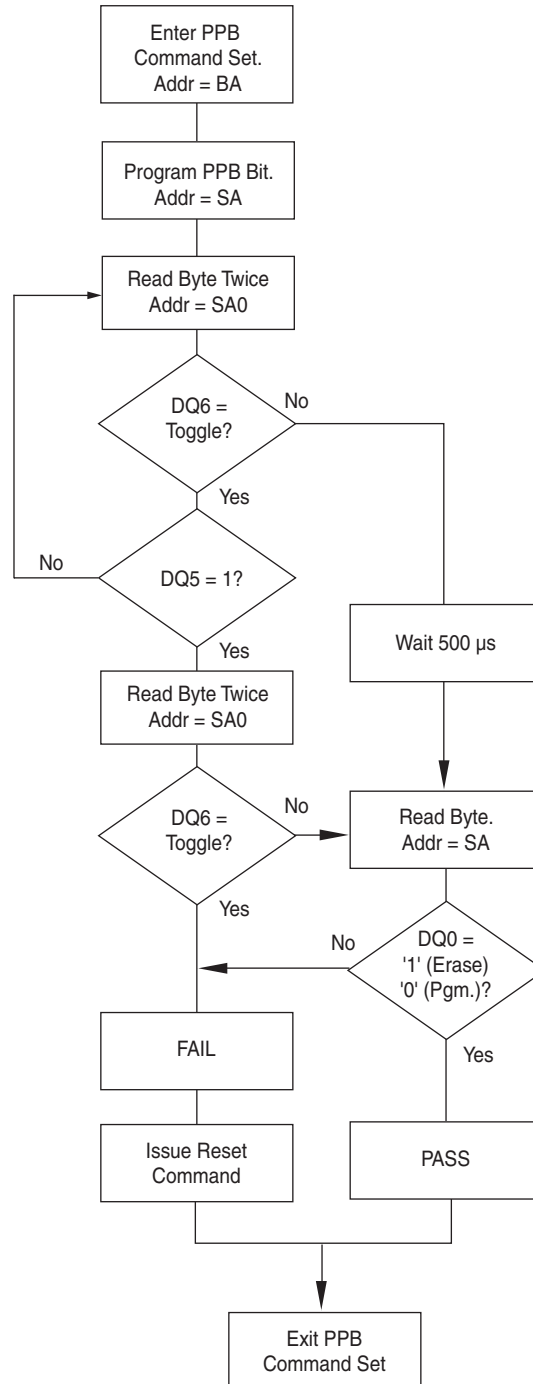

8.2.1 Dynamic Protection Bits

Dynamic Protection Bits are volatile and unique for each sector and can be individually modified. DYBs only control the protection scheme for unprotected sectors that have their PPBs cleared (erased to "1"). By issuing the DYB Set or Clear command sequences, the DYBs are set (programmed to "0") or cleared (erased to "1"), thus placing each sector in the protected or unprotected state respectively. This feature allows software to easily protect sectors against inadvertent changes yet does not prevent the easy removal of protection when changes are needed.

Notes

1. The DYBs can be set (programmed to "0") or cleared (erased to "1") as often as needed. When the parts are first shipped, the PPBs are cleared (erased to "1") and upon power up or reset, the DYBs can be set or cleared depending upon the ordering option chosen.

2. If the option to clear the DYBs after power up is chosen, (erased to "1"), then the sectorsmay be modified depending upon the PPB state of that sector (see Table 8.2).

3. The sectors would be in the protected state If the option to set the DYBs after power up is chosen (programmed to "0").

4. It is possible to have sectors that are persistently locked with sectors that are left in the dynamic state.

5. The DYB Set or Clear commands for the dynamic sectors signify protected or unprotectedstate of the sectors respectively. However, if there is a need to change the status of the persistently locked sectors, a few more steps are required. First, the PPB Lock Bit must be cleared by either putting the device through a power-cycle, or hardware reset. The PPBs can then be changed to reflect the desired settings. Setting the PPB Lock Bit once again locks the PPBs, and the device operates normally again.

6. To achieve the best protection, it is recommended to execute the PPB Lock Bit Set command early in the boot code and protect the boot code by holding WP#/ACC = V_{IL}. Note that the PPB and DYB bits have the same function when WP#/ACC = V_{HH} as they do when ACC =V_{IH}.

8.3 Persistent Protection Bit Lock Bit

The Persistent Protection Bit Lock Bit is a global volatile bit for all sectors. When set (programmed to "0"), it locks all PPBs and when cleared (programmed to "1"), allows the PPBs to be changed. There is only one PPB Lock Bit per device.

Notes

1. No software command sequence unlocks this bit unless the device is in the password protection mode; only a hardware reset or a power-up clears this bit.

2. The PPB Lock Bit must be set (programmed to "0") only after all PPBs are configured to the desired settings.

8.4 Password Protection Method

The Password Protection Method allows an even higher level of security than the Persistent Sector Protection Mode by requiring a 64-bit password for unlocking the device PPB Lock Bit. In addition to this password requirement, after power up and reset, the PPB Lock Bit is set "0" to maintain the password mode of operation. Successful execution of the Password Unlock command by entering the entire password clears the PPB Lock Bit, allowing for sector PPBs modifications.

Notes

1. There is no special addressing order required for programming the password. Once the Password is written and verified, the Password Mode Locking Bit must be set in order to prevent access.

2. The Password Program Command is only capable of programming "0"s. Programming a "1" after a cell is programmed as a "0" results in a time-out with the cell as a "0".

3. The password is all "1"s when shipped from the factory.

4. All 64-bit password combinations are valid as a password.

5. There is no means to verify what the password is after it is set.

6. The Password Mode Lock Bit, once set, prevents reading the 64-bit password on the data bus and further password programming.

7. The Password Mode Lock Bit is not erasable.

8. The lower two address bits (A1–A0) are valid during the Password Read, Password Program, and Password Unlock.

9. The exact password must be entered in order for the unlocking function to occur.

10. The Password Unlock command cannot be issued any faster than 1 µs at a time to prevent a hacker from running through all the 64-bit combinations in an attempt to correctly match a password.

11. Approximately 1 µs is required for unlocking the device after the valid 64-bit password is given to the device.

12. Password verification is only allowed during the password programming operation.

13. All further commands to the password region are disabled and all operations are ignored.

14. If the password is lost after setting the Password Mode Lock Bit, there is no way to clear the PPB Lock Bit.

15. Entry command sequence must be issued prior to any of any operation and it disables reads and writes for Sector 0. Reads and writes for other sectors excluding Sector 0 are allowed.

16. If the user attempts to program or erase a protected sector, the device ignores the command and returns to read mode.

17. A program or erase command to a protected sector enables status polling and returns to read mode without having modified the contents of the protected sector.

18. The programming of the DYB, PPB, and PPB Lock for a given sector can be verified by writing individual status read commands DYB Status, PPB Status, and PPB Lock Status to the device.

Figure 8.3 Lock Register Program Algorithm

Write Unlock Cycles:
Address 555h, Data AAh
Address 2AAh, Data 55h

Unlock Cycle 1

Device returns to reading array.

FAIL. Write rest command
to return to reading array.

8.5 Advanced Sector Protection Software Examples

Table 8.2 Sector Protection Schemes: DYB, PPB and PPB Lock Bit Combinations

Unique Device PPB Lock Bit 0 = locked 1 = unlocked		Sector PPB 0 = protected 1 = unprotected	Sector DYB 0 = protected 1 = unprotected	Sector Protection Status
Any Sector	0	0	x	Protected through PPB
Any Sector	0	0	x	Protected through PPB
Any Sector	0	1	1	Unprotected
Any Sector	0	1	0	Protected through DYB
Any Sector	1	0	x	Protected through PPB
Any Sector	1	0	x	Protected through PPB
Any Sector	1	1	0	Protected through DYB
Any Sector	1	1	1	Unprotected

Table 8.2 contains all possible combinations of the DYB, PPB, and PPB Lock Bit relating to the status of the sector. In summary, if the PPB Lock Bit is locked (set to "0"), no changes to the PPBs are allowed. The PPB Lock Bit can only be unlocked (reset to "1") through a hardware reset or power cycle. See also Figure 8.1 for an overview of the Advanced Sector Protection feature.

8.6 Hardware Data Protection Methods

The device offers two main types of data protection at the sector level via hardware control:

- When WP#/ACC is at V_{IL}, the either the highest or lowest sector is locked (device specific).

There are additional methods by which intended or accidental erasure of any sectors can be prevented via hardware means. The following subsections describes these methods:

8.6.1 WP#/ACC Method

The Write Protect feature provides a hardware method of protecting one outermost sector. This function is provided by the WP#/ACC pin and overrides the previously discussed Sector Protection/Unprotection method.

If the system asserts V_{IL} on the WP#/ACC pin, the device disables program and erase functions in the highest or lowest sector independently of whether the sector was protected or unprotected using the method described in "Advanced Sector Protection/Unprotection" section.

If the system asserts V_{IH} on the WP#/ACC pin, the device reverts to whether the boot sectors were last set to be protected or unprotected. That is, sector protection or unprotection for these sectors depends on whether they were last protected or unprotected.

Note that the WP#/ACC pin must not be left floating or unconnected as inconsistent behavior of the device may result.

The WP#/ACC pin must be held stable during a command sequence execution.

Note
If WP#/ACC is at V_{IL} when the device is in the standby mode, the maximum input load current is increased. See Table 11.6 on page 50 for details.

8.6.2 Low V_{CC} Write Inhibit

When V_{CC} is less than V_{LKO}, the device does not accept any write cycles. This protects data during V_{CC} power-up and power-down.

The command register and all internal program/erase circuits are disabled, and the device resets to reading array data. Subsequent writes are ignored until V_{CC} is greater than V_{LKO}. The system must provide the proper signals to the control inputs to prevent unintentional writes when V_{CC} is greater than V_{LKO}.

8.6.3 Write Pulse "Glitch Protection"

Noise pulses of less than 5 ns (typical) on OE#, CE# or WE# do not initiate a write cycle.

8.6.4 Power-Up Write Inhibit

If WE# = CE# = RESET# = V_{IL} and OE# = V_{IH} during power up, the device does not accept commands on the rising edge of WE#. The internal state machine is automatically reset to the read mode on power-up.

9. Power Conservation Modes

9.1 Standby Mode

When the system is not reading or writing to the device, it can place the device in the standby mode. In this mode, current consumption is greatly reduced, and the outputs are placed in the high impedance state, independent of the OE# input. The device enters the CMOS standby mode when the CE# and RESET# inputs are both held at $V_{CC} \pm 0.3$ V. The device requires standard access time (t_{CE}) for read access, before it is ready to read data. If the device is deselected during erasure or programming, the device draws active current until the operation is completed. I_{CC4} in "DC Characteristics" represents the standby current specification

9.2 Automatic Sleep Mode

The automatic sleep mode minimizes Flash device energy consumption. The device automatically enables this mode when addresses remain stable for t_{ACC} + 30 ns. The automatic sleep mode is independent of the CE#, WE#, and OE# control signals. Standard address access timings provide new data when addresses are changed. While in sleep mode, output data is latched and always available to the system. I_{CC6} in Section 11.6 represents the automatic sleep mode current specification.

9.3 Hardware RESET# Input Operation

The RESET# input provides a hardware method of resetting the device to reading array data. When RESET# is driven low for at least a period of t_{RP}, the device immediately terminates any operation in progress, tristates all outputs, and ignores all read/write commands for the duration of the RESET# pulse. The device also resets the internal state machine to reading array data. The operation that was interrupted should be reinitiated once the device is ready to accept another command sequence to ensure data integrity.

When RESET# is held at $V_{SS} \pm 0.3$ V, the device draws I_{CC} reset current (I_{CC5}). If RESET# is held at V_{IL} but not within $V_{SS} \pm 0.3$ V, the standby current is greater.

RESET# may be tied to the system reset circuitry and thus, a system reset would also reset the Flash memory, enabling the system to read the boot-up firmware from the Flash memory.

9.4 Output Disable (OE#)

When the OE# input is at V_{IH}, output from the device is disabled. The outputs are placed in the high impedance state.

10. Secured Silicon Sector Flash Memory Region

The Secured Silicon Sector provides an extra Flash memory region that enables permanent part identification through an Electronic Serial Number (ESN). The Secured Silicon Sector is 128 words in length and all Secured Silicon reads outside of the 128-word address range returns invalid data. The Secured Silicon Sector Indicator Bit, DQ7, (at Autoselect address 03h) is used to indicate whether or not the Secured Silicon Sector is locked when shipped from the factory.

Please note the following general conditions:

■ On power-up, or following a hardware reset, the device reverts to sending commands to the normal address space.

■ Reads outside of sector SA0 return memory array data.

■ Sector SA0 is remapped from memory array to Secured Silicon Sector array.

■ Once the Secured Silicon Sector Entry Command is issued, the Secured Silicon Sector Exit command must be issued to exit Secured Silicon Sector Mode.

■ The Secured Silicon Sector is not accessible when the device is executing an Embedded Program or Embedded Erase algorithm.

■ The ACC function and unlock bypass modes are not available when the Secured Silicon Sector is enabled.

Table 10.1 Secured Silicon Sector Addresses

Secured Silicon Sector Address Range	Customer Lockable	ESN Factory Locked	ExpressFlash Factory Locked
000000h–000007h	Determined by customer	ESN	ESN or determined by customer
000008h–00007Fh		Unavailable	Determined by customer

10.1 Factory Locked Secured SiliconSector

The Secured Silicon Sector is always protected when shipped from the factory and has the Secured Silicon Sector Indicator Bit (DQ7) permanently set to a "1". This prevents cloning of a factory locked part and ensures the security of the ESN and customer code once the product is shipped to the field.

These devices are available pre-programmed with one of the following:

■ A random, 8 Word secure ESN only within the Secured Silicon Sector (at addresses 000000H - 000007H)

■ Both a random, secure ESN and customer code through the Spansion programming service.

Customers may opt to have their code programmed through the Spansion programming services. Spansion programs the customer's code, with or without the random ESN. The devices are then shipped from the Spansion factory with the Secured Silicon Sector permanently locked. Contact your local representative for details on using Spansion programming services.

10.2 Customer Lockable Secured Silicon Sector

The Secured Silicon Sector is typically shipped unprotected (DQ7 set to "0"), allowing customers to utilize that sector in any manner they choose. If the security feature is not required, the Secured Silicon Sector can be treated as an additional Flash memory space.

Please note the following:

■ Once the Secured Silicon Sector area is protected, the Secured Silicon Sector Indicator Bit is permanently set to "0."

■ The Secured Silicon Sector can be read any number of times, but can be programmed and locked only once. The Secured Silicon Sector lock must be used with caution as once locked, there is no procedure available for unlocking the Secured Silicon Sector area and none of the bits in the Secured Silicon Sector memory space can be modified in any way.

■ The accelerated programming (ACC) and unlock bypass functions are not available when the Secured Silicon Sector is enabled.

■ Once the Secured Silicon Sector is locked and verified, the system must write the Exit Secured Silicon Sector Region command sequence which return the device to the memory array at sector 0.

10.3   Secured Silicon Sector Entry/Exit Command Sequences

The system can access the Secured Silicon Sector region by issuing the three-cycle Enter Secured Silicon Sector command sequence. The device continues to access the Secured Silicon Sector region until the system issues the four-cycle Exit Secured Silicon Sector command sequence.

See Command Definition Table [Secured Silicon Sector Command Table, Appendix Table 12.1 on page 61 through Table 12.4 on page 65 for address and data requirements for both command sequences.

The Secured Silicon Sector Entry Command allows the following commands to be executed

■ Read customer and factory Secured Silicon areas

■ Program the customer Secured Silicon Sector

After the system has written the Enter Secured Silicon Sector command sequence, it may read the Secured Silicon Sector by using the addresses normally occupied by sector SA0 within the memory array. This mode of operation continues until the system issues the Exit Secured Silicon Sector command sequence, or until power is removed from the device.

Software Functions and Sample Code

The following are C functions and source code examples of using the Secured Silicon Sector Entry, Program, and exit commands. Refer to the *Spansion Low Level Driver User's Guide* (available soon on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

Table 10.2 Secured Silicon Sector Entry
(LLD Function = lld_SecSiSectorEntryCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	Base + AAAh	Base + 555h	00AAh
Unlock Cycle 2	Write	Base + 555h	Base + 2AAh	0055h
Entry Cycle	Write	Base + AAAh	Base + 555h	0088h

Note
Base = Base Address.

```
/* Example: SecSi Sector Entry Command */
  *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1         */
  *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2         */
  *( (UINT16 *)base_addr + 0x555 ) = 0x0088;   /* write Secsi Sector Entry Cmd   */
```

Table 10.3 Secured Silicon Sector Program
(LLD Function = lld_ProgramCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	Base + AAAh	Base + 555h	00AAh
Unlock Cycle 2	Write	Base + 555h	Base + 2AAh	0055h
Program Setup	Write	Base + AAAh	Base + 555h	00A0h
Program	Write	Word Address	Word Address	Data Word

Note
Base = Base Address.

```
/* Once in the SecSi Sector mode, you program */
/* words using the programming algorithm.     */
```

Table 10.4 Secured Silicon Sector Exit
(LLD Function = lld_SecSiSectorExitCmd)

Cycle	Operation	Byte Address	Word Address	Data
Unlock Cycle 1	Write	Base + AAAh	Base + 555h	00AAh
Unlock Cycle 2	Write	Base + 555h	Base + 2AAh	0055h
Exit Cycle 3	Write	Base + AAAh	Base + 555h	0090h
Exit Cycle 4	Write	Base + AAAh	Base + 000h	0000h

Note
Base = Base Address.

```
/* Example: SecSi Sector Exit Command */
   *( (UINT16 *)base_addr + 0x555 ) = 0x00AA;   /* write unlock cycle 1          */
   *( (UINT16 *)base_addr + 0x2AA ) = 0x0055;   /* write unlock cycle 2          */
   *( (UINT16 *)base_addr + 0x555 ) = 0x0090;   /* write SecSi Sector Exit cycle 3 */
   *( (UINT16 *)base_addr + 0x000 ) = 0x0000;   /* write SecSi Sector Exit cycle 4 */
```

11. Electrical Specifications

11.1 Absolute Maximum Ratings

Description		Rating
Storage Temperature, Plastic Packages		−65°C to +150°C
Ambient Temperature with Power Applied		−65°C to +125°C
Voltage with Respect to Ground	All Inputs and I/Os except as noted below (Note 1)	−0.5 V to V_{CC} + 0.5 V
	V_{CC} (Note 1)	−0.5 V to +4.0 V
	V_{IO}	−0.5V to +4.0V
	A9 and ACC (Note 2)	−0.5 V to +12.5 V
Output Short Circuit Current (Note 3)		200 mA

Notes
1. *Minimum DC voltage on input or I/Os is −0.5 V. During voltage transitions, inputs or I/Os may undershoot V_{SS} to −2.0 V for periods of up to 20 ns. See Figure 11.1. Maximum DC voltage on input or I/Os is V_{CC} + 0.5 V. During voltage transitions inputs or I/Os may overshoot to V_{CC} + 2.0 V for periods up to 20 ns. See Figure 11.2.*
2. *Minimum DC input voltage on pins A9 and ACC is -0.5V. During voltage transitions, A9 and ACC may overshoot V_{SS} to −2.0 V for periods of up to 20 ns. See Figure 11.1. Maximum DC voltage on pins A9 and ACC is +12.5 V, which may overshoot to 14.0 V for periods up to 20 ns.*
3. *No more than one output may be shorted to ground at a time. Duration of the short circuit should not be greater than one second.*
4. *Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this data sheet is not implied. Exposure of the device to absolute maximum rating conditions for extended periods may affect device reliability.*

Figure 11.1 Maximum Negative Overshoot Waveform
Figure 11.2 Maximum Positive Overshoot Waveform
11.2   Operating Ranges

Specifications		Range
Ambient Temperature (TA), Industrial (I) Device		−40°C to +85°C
Supply Voltages	V_{CC}	+2.7 V to 3.6 V or +3.0 V to 3.6 V
V_{IO} Supply Voltages	V_{IO}	+1.65 V to V_{CC}

Notes

1. Operating ranges define those limits between which the functionality of the device is guaranteed.

2. See also Ordering Information on page 5.

3. For valid V_{CC}/V_{IO} range combinations, see Ordering Information on page 5. The I/Os do not operate at 3 V when V_{IO} = 1.8 V.

11.3   Test Conditions

Figure 11.3 Test Setup
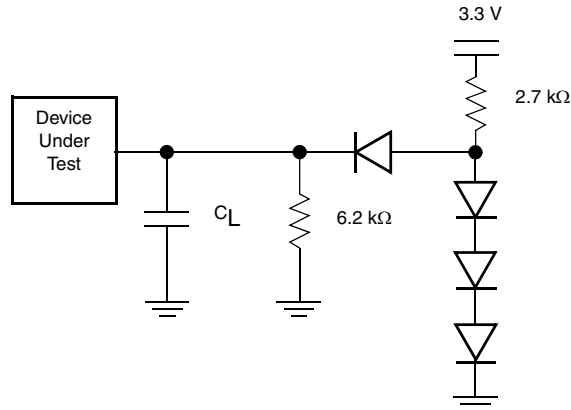

Note
Diodes are IN3064 or equivalent.

Table 11.1 Test Specifications

Test Condition	All Speeds	Unit
Output Load	1 TTL gate	
Output Load Capacitance, C_L (including jig capacitance)	30	pF
Input Rise and Fall Times	5	ns
Input Pulse Levels	0.0–V_{IO}	V
Input timing measurement reference levels (See Note)	0.5V_{IO}	V
Output timing measurement reference levels	0.5 V_{IO}	V

Note
If $V_{IO} < V_{CC}$, the reference level is 0.5 V_{IO}.

11.4 Key to Switching Waveforms

Waveform	Inputs	Outputs
	Steady	
	Changing from H to L	
	Changing from L to H	
	Don't Care, Any Change Permitted	Changing, State Unknown
	Does Not Apply	Center Line is High Impedance State (High Z)

11.5 Switching Waveforms

Figure 11.4 Input Waveforms and Measurement Levels

V_{IO}

Input   0.5 V_{IO} Measurement Level   0.5 V_{IO} V   Output

0.0 V

Note
If $V_{IO} < V_{CC}$, the input measurement reference level is 0.5 V_{IO}.

11.6 DC Characteristics

Table 11.2 S29GL-P DC Characteristics (CMOS Compatible)

Parameter Symbol	Parameter Description (Notes)	Test Conditions		Min	Typ	Max	Unit
I_{LI}	Input Load Current (1)	$V_{IN} = V_{SS}$ to V_{CC} $V_{CC} = V_{CC\ max}$	WP/ACC			±2.0	µA
			Others			±1.0	
I_{LIT}	A9 Input Load Current	$V_{CC} = V_{CC\ max}$; A9 = 12.5 V				35	µA
I_{LO}	Output Leakage Current	$V_{OUT} = V_{SS}$ to V_{CC} , $V_{CC} = V_{CC\ max}$				±1.0	µA
I_{CC1}	V_{CC} Active Read Current (1)	CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}, f = 1 MHz			6	20	mA
		CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}, f = 5 MHz			30	50	
		CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}, f = 10 MHz			60	100	
I_{IO2}	V_{IO} Non-Active Output	CE# = $V_{IL,}$ OE# = V_{IH}			0.2	10	mA
I_{CC2}	V_{CC} Intra-Page Read Current (1)	CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}, f = 10 MHz			1	10	mA
		CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}, f = 33 MHz			5	20	
I_{CC3}	V_{CC} Active Erase/ Program Current (2, 3)	CE# = V_{IL}, OE# = V_{IH}, V_{CC} = V_{CCmax}			50	90	mA
I_{CC4}	V_{CC} Standby Current	CE#, RESET# = V_{CC} ± 0.3 V, OE# = V_{IH}, V_{CC} = V_{CCmax} V_{IL} = V_{SS} + 0.3 V/-0.1V,			1	5	µA
I_{CC5}	V_{CC} Reset Current	V_{CC} = V_{CCmax}; V_{IL} = V_{SS} + 0.3 V/-0.1V, RESET# = V_{SS} ± 0.3 V			250	500	µA
I_{CC6}	Automatic Sleep Mode (4)	V_{CC} = V_{CCmax}, V_{IH} = V_{CC} ± 0.3 V, V_{IL} = V_{SS} + 0.3 V/-0.1V, WP#/ACC = V_{IH}			1	5	µA
I_{ACC}	ACC Accelerated Program Current	CE# = $V_{IL,}$ OE# = $V_{IH,}$ V_{CC} = V_{CCmax}, WP#/ACC = V_{HH}	WP#/ACC pin		10	20	mA
			V_{CC} pin		50	80	
V_{IL}	Input Low Voltage (5)			−0.1		0.3 x V_{IO}	V
V_{IH}	Input High Voltage (5)			0.7 x V_{IO}		V_{IO} + 0.3	V
V_{HH}	Voltage for Program Acceleration	V_{CC} = 2.7 –3.6 V		11.5		12.5	V
V_{ID}	Voltage for Autoselect and Temporary Sector Unprotect	V_{CC} = 2.7 –3.6 V		11.5		12.5	V
V_{OL}	Output Low Voltage (5)	I_{OL} = 100 µA				0.15 x V_{IO}	V
V_{OH}	Output High Voltage (5)	I_{OH} = -100 µA		0.85 x V_{IO}			V
V_{LKO}	Low V_{CC} Lock-Out Voltage (3)			2.3		2.5	V

Notes

1. The I_{CC} current listed is typically less than 2 mA/MHz, with OE# at V_{IH}.

2. I_{CC} active while Embedded Erase or Embedded Program or Write Buffer Programming is in progress.

3. Not 100% tested.

4. Automatic sleep mode enables the lower power mode when addresses remain stable tor t_{ACC} + 30 ns.

5. V_{IO} = 1.65–3.6 V

6. V_{CC} = 3 V and V_{IO} = 3V or 1.8V. When V_{IO} is at 1.8V, I/O pins cannot operate at 3V.

11.7   AC Characteristics

11.7.1   S29GL-P Read-Only Operations

Table 11.3 S29GL-P Read-Only Operations

Parameter		Description (Notes)	Test Setup		Speed Options				Unit
JEDEC	Std.				110	110	120	130	
t_{AVAV}	t_{RC}	Read Cycle Time	$V_{IO} = V_{CC} = 2.7$ V	Min	110		120		ns
			$V_{IO} = 1.65$ V to V_{CC}, $V_{CC} = 3$ V			110		130	
t_{AVQV}	t_{ACC}	Address to Output Delay (1)	$V_{IO} = V_{CC} = 2.7$ V	Max	110		120		ns
			$V_{IO} = 1.65$ V to V_{CC}, $V_{CC} = 3$ V			110		130	ns
t_{ELQV}	t_{CE}	Chip Enable to Output Delay (2)	$V_{IO} = V_{CC} = 2.7$ V	Max	110		120		ns
			$V_{IO} = 1.65$ V to V_{CC}, $V_{CC} = 3$ V			110		130	ns
	t_{PACC}	Page Access Time		Max	25	25	25	25	ns

t_{EHQZ}	t_{DF}	Chip Enable to Output High Z (3)		Max	20				ns
t_{GHQZ}	t_{DF}	Output Enable to Output High Z (3)		Max	20				ns
t_{AXQX}	t_{OH}	Output Hold Time From Addresses, CE# or OE#, Whichever Occurs First		Min	0				ns
	t_{OEH}	Output Enable Hold Time (3)	Read	Min	0				ns
			Toggle and Data# Polling	Min	10				ns
	t_{CEH}	Chip Enable Hold Time	Read	Min	35				ns

Notes

1. CE#, OE# = V_{IL}

2. OE# = V_{IL}

3. Not 100% tested.

4. See Figure 11.3 and Table 11.1 for test specifications.

5. Unless otherwise indicated, AC specifications for 110 ns speed options are tested with $V_{IO} = V_{CC} = 2.7$ V. AC specifications for 110 ns speed options are tested with $V_{IO} = 1.8$ V and $V_{CC} = 3.0$ V.

Figure 11.5 Read Operation Timings
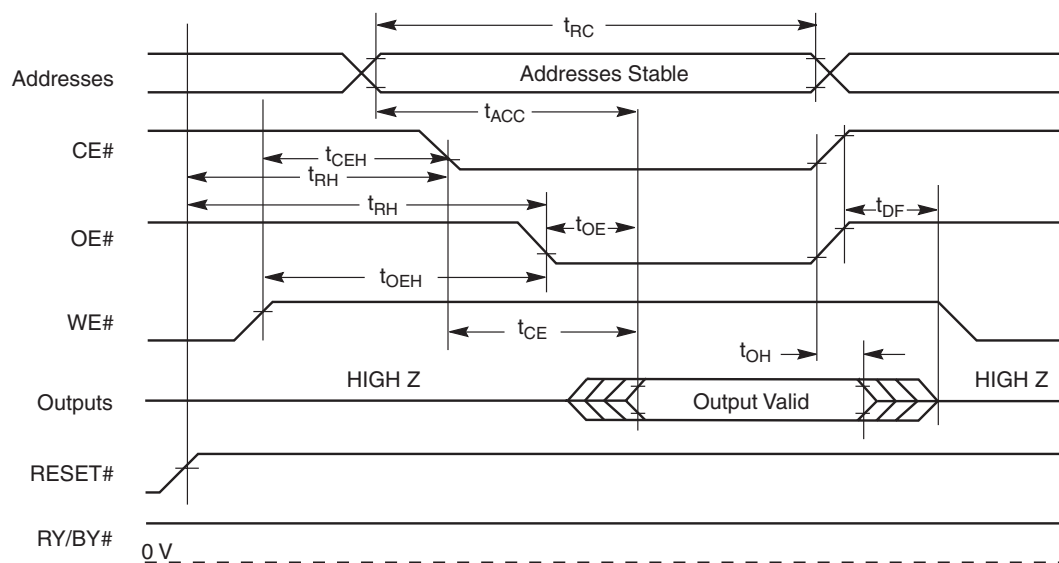

Figure 11.6 Page Read Timings
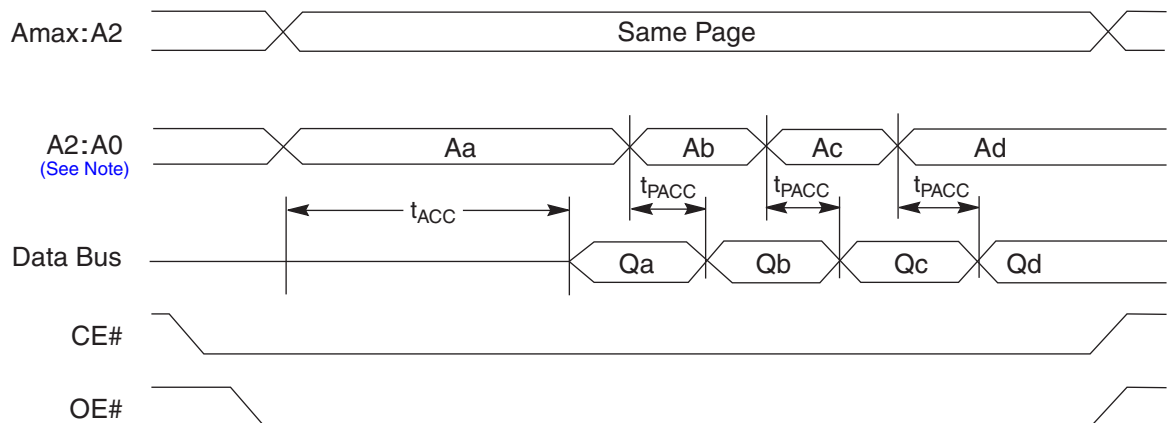

Note
Figure 11.6 shows word mode. Addresses are A2:A-1 for byte mode.

11.7.2   Hardware Reset (RESET#)

Table 11.4 Hardware Reset (RESET#)

Parameter		Description		Speed	Unit
JEDEC	Std.				
	t_{Ready}	RESET# Pin Low (During Embedded Algorithms) to Read Mode or Write mode	Min	35	µs
	t_{Ready}	RESET# Pin Low (NOT During Embedded Algorithms) to Read Mode or Write mode	Min	35	µs
	t_{RP}	RESET# Pulse Width	Min	35	µs
	t_{RH}	Reset High Time Before Read	Min	200	ns
	t_{RPD}	RESET# Low to Standby Mode	Min	10	µs
	t_{RB}	RY/BY# Recovery Time	Min	0	ns

Figure 11.7 Reset Timings

Reset Timings NOT during Embedded Algorithms

Reset Timings during Embedded Algorithms
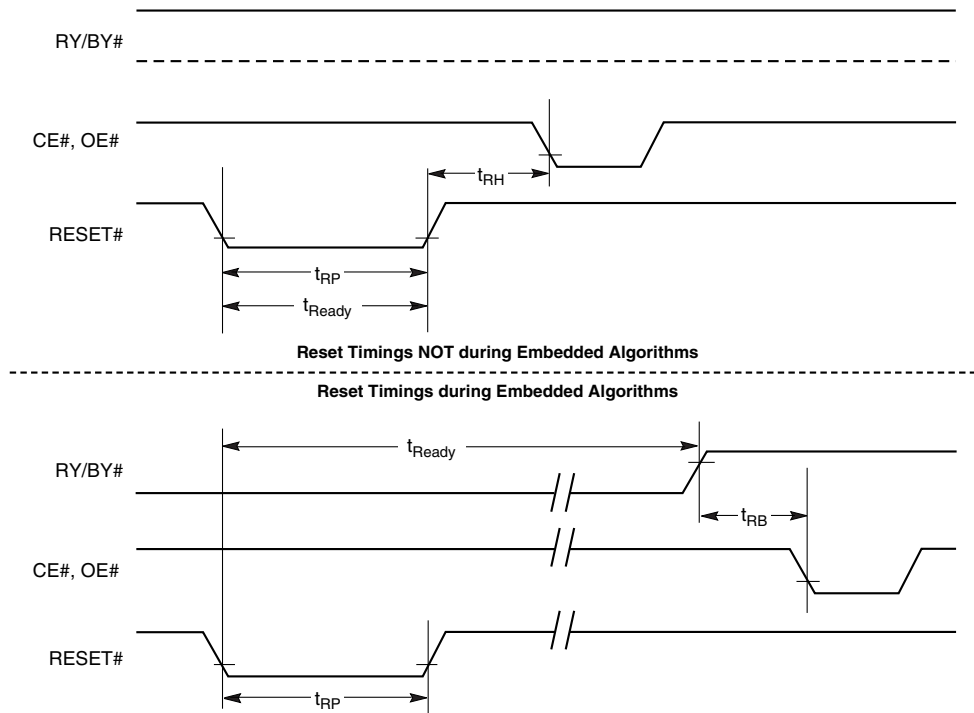

Note
CE#, OE# and WE# must be at logic high during Reset Time.

Table 11.5 Power-up Sequence Timings

Parameter	Description		Speed	Unit
t_{VCS}	Reset Low Time from rising edge of V_{CC} (or last Reset pulse) to rising edge of RESET#	Min	35	µs
t_{VIOS}	Reset Low Time from rising edge of V_{IO} (or last Reset pulse) to rising edge of RESET#	Min	35	µs
t_{RH}	Reset High Time before Read	Max	200	ns

Notes

1. $V_{IO} < V_{CC} + 200\ mV$.

2. V_{IO} and V_{CC} ramp must be synchornized during power up.

3. If RESET# is not stable for t_{VCS} or t_{VIOS}:
   The device does not permit any read and write operations.
   A valid read operation returns FFh.
   A hardware reset is required.

4. V_{CC} maximum power-up current (RST=V_{IL}) is 20 mA.

Figure 11.8 Power-up Sequence Timings
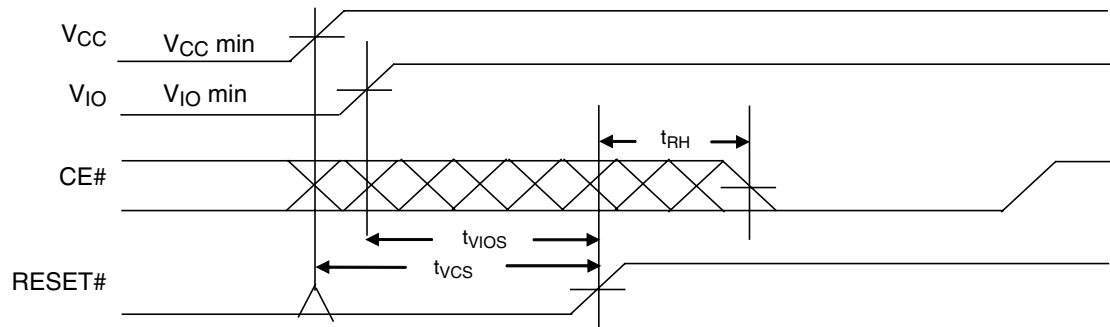

11.7.3 S29GL-P Erase and Program Operations

Table 11.6 S29GL-P Erase and Program Operations

Parameter				Unit	Speed Options			Unit
JEDEC	Std.	Description			110	120	130	
t_{AVAV}	t_{WC}	Write Cycle Time (Note 1)		Min	110 (Note 6)	120	130	ns
t_{AVWL}	t_{AS}	Address Setup Time		Min	0			ns
	t_{ASO}	Address Setup Time to OE# low during toggle bit polling		Min	15			ns
t_{WLAX}	t_{AH}	Address Hold Time		Min	45			ns
	t_{AHT}	Address Hold Time From CE# or OE# high during toggle bit polling		Min	0			ns
t_{DVWH}	t_{DS}	Data Setup Time		Min	45			ns
t_{WHDX}	t_{DH}	Data Hold Time		Min	0			ns
	t_{CEPH}	CE# High during toggle bit polling		Min	20			ns
	t_{OEPH}	Output Enable High during toggle bit polling		Min	20			ns
t_{GHWL}	t_{GHWL}	Read Recovery Time Before Write (OE# High to WE# Low)		Min	0			ns
t_{ELWL}	t_{CS}	CE# Setup Time		Min	0			ns
t_{WHEH}	t_{CH}	CE# Hold Time		Min	0			ns
t_{WLWH}	t_{WP}	Write Pulse Width		Min	35			ns
t_{WHDL}	t_{WPH}	Write Pulse Width High		Min	30			ns
t_{WHWH1}	t_{WHWH1}	Write Buffer Program Operation (Notes 2, 3)		Typ	480			µs
		Effective Write Buffer Program Operation (Notes 2, 4)	Per Word	Typ	15			µs
		Accelerated Effective Write Buffer Program Operation (Notes 2, 4)	Per Word	Typ	13.5			µs
		Program Operation (Note 2)	Word	Typ	60			µs
		Accelerated Programming Operation (Note 2)	Word	Typ	54			µs
t_{WHWH2}	t_{WHWH2}	Sector Erase Operation (Note 2)		Typ	0.5			sec
	t_{VHH}	V_{HH} Rise and Fall Time (Note 1)		Min	250			ns
	t_{VCS}	V_{CC} Setup Time (Note 1)		Min	35			µs
	t_{BUSY}	Erase/Program Valid to RY/BY# Delay		Max	90			ns
	t_{SEA}	Command Cycle Timout		Max	50			µs

Notes

1. Not 100% tested.

2. See Section 11.6 for more information.

3. For 1–32 words/1–64 bytes programmed.

4. Effective write buffer specification is based upon a 32-word/64-byte write buffer operation.

5. Unless otherwise indicated, AC specifications for 110 ns speed option are tested with
   $V_{IO} = V_{CC} = 2.7$ V. AC specifications for 110 ns speed options are tested with $V_{IO} = 1.8$ V and $V_{CC} = 3.0$ V.
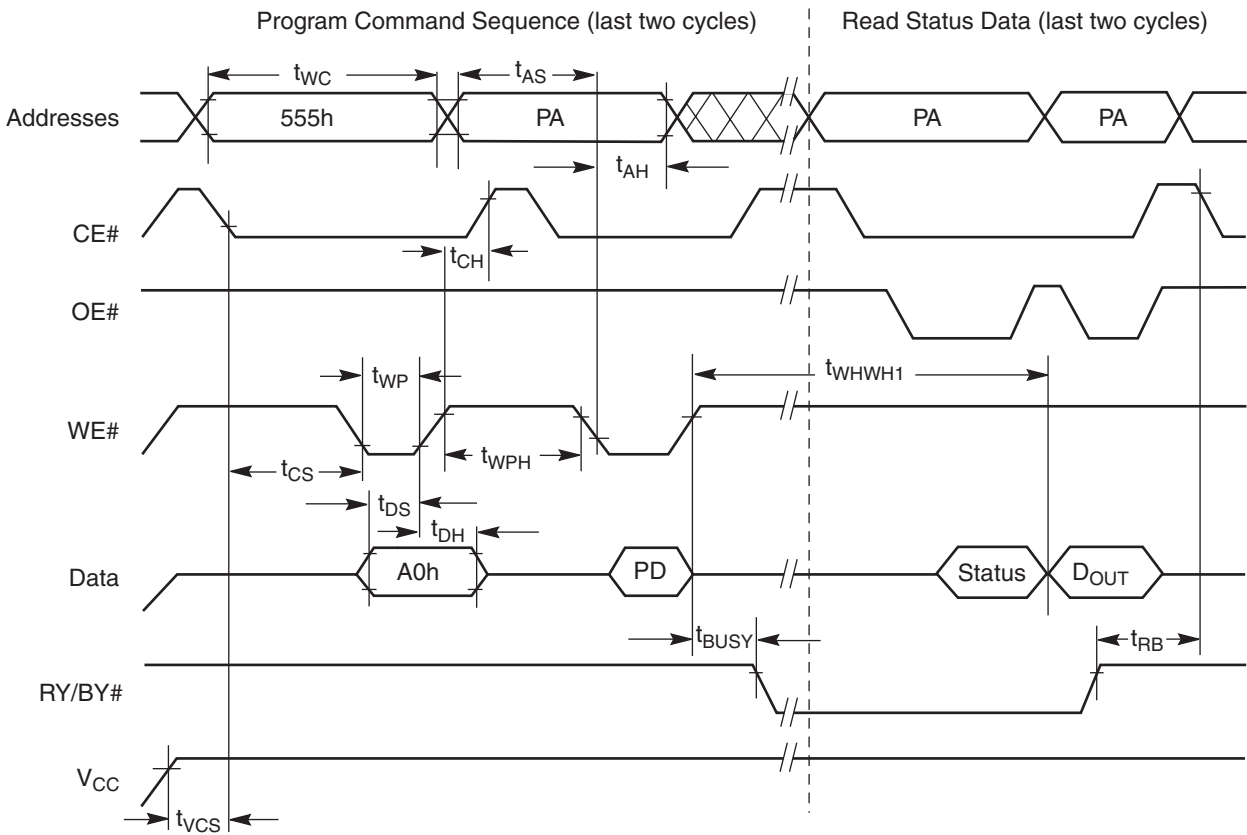

6. Write Cycle Time = Access Time at V_{CC}.

Figure 11.9 Program Operation Timings

Notes

1. PA = program address, PD = program data, D_{OUT} is the true data at the program address.

2. Illustration shows device in word mode.

Figure 11.10 Accelerated Program Timing Diagram
Notes

1. Not 100% tested.

2. CE#, OE# = V_{IL}

3. OE# = V_{IL}

4. See Figure 11.3 and Table 11.1 for test specifications.

Figure 11.11 Chip/Sector Erase Operation Timings
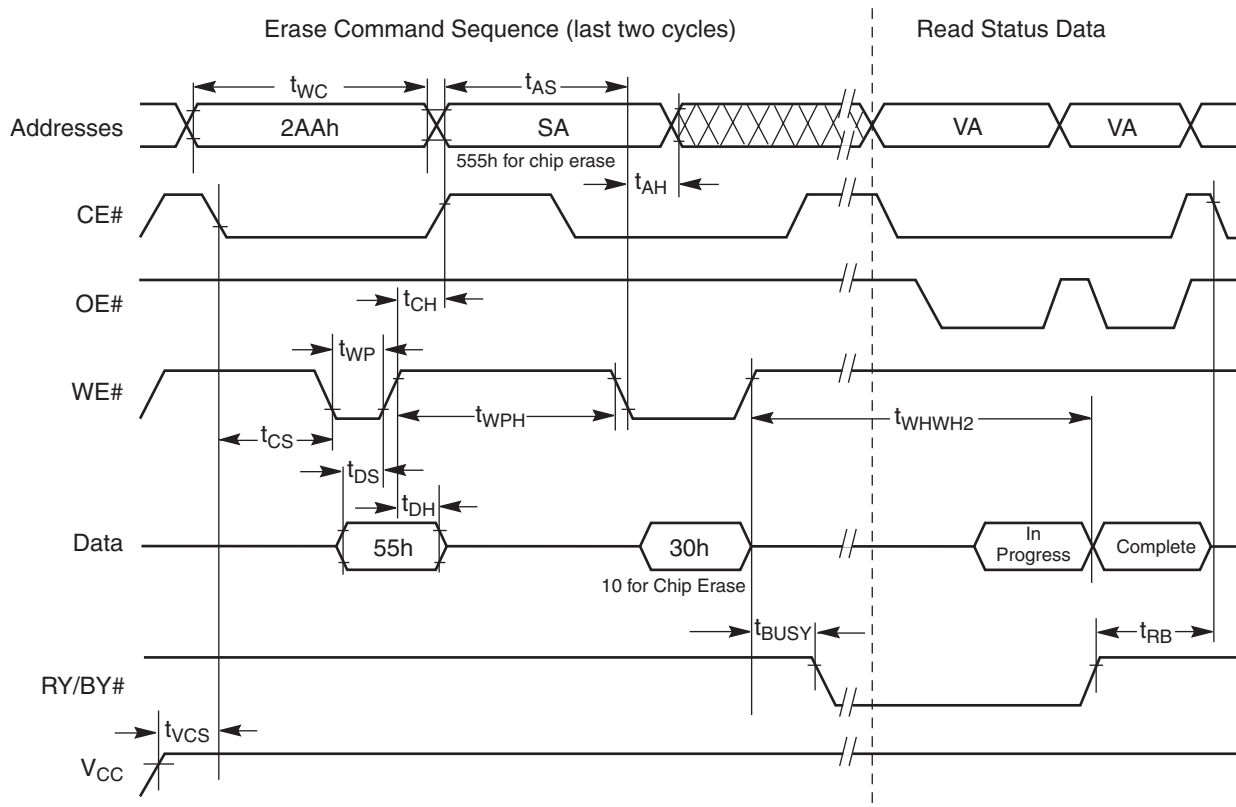

Notes

1. SA = sector address (for Sector Erase), VA = Valid Address for reading status data (see "Write Operation Status.")

2. These waveforms are for the word mode

Figure 11.12 Data# Polling Timings (During Embedded Algorithms)
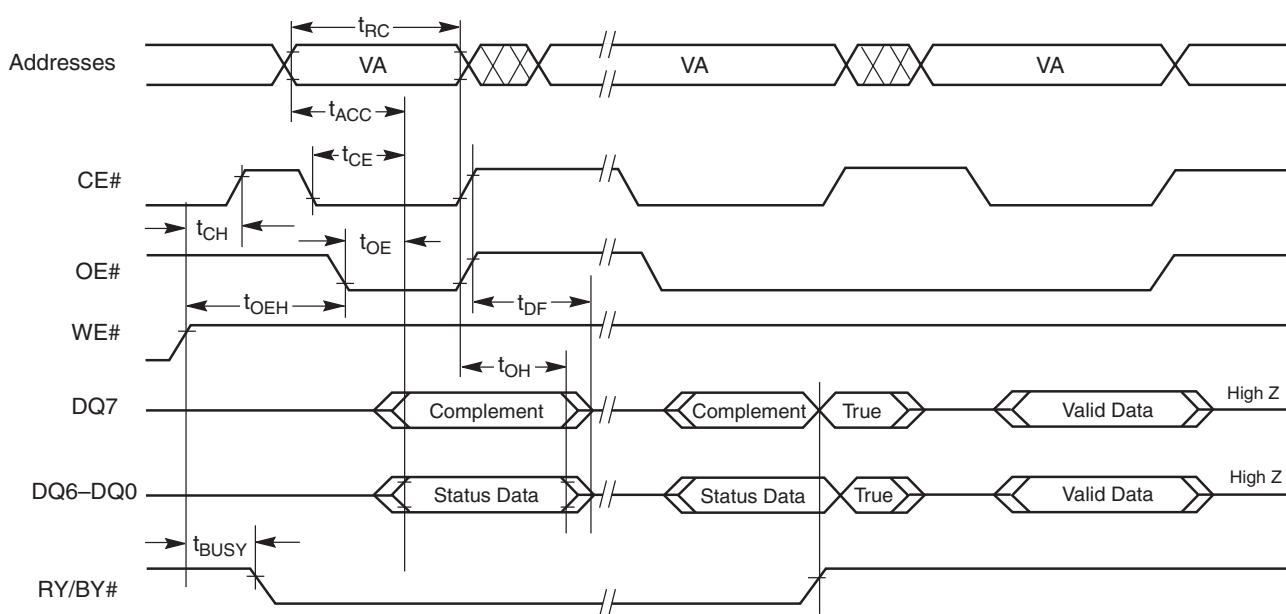

Notes

1. VA = Valid address. Illustration shows first status cycle after command sequence, last status read cycle, and array data read cycle.

2. t_{OE} for data polling is 45 ns when V_{IO} = 1.65 to 2.7 V and is 35 ns when V_{IO} = 2.7 to 3.6 V

Figure 11.13 Toggle Bit Timings (During Embedded Algorithms)
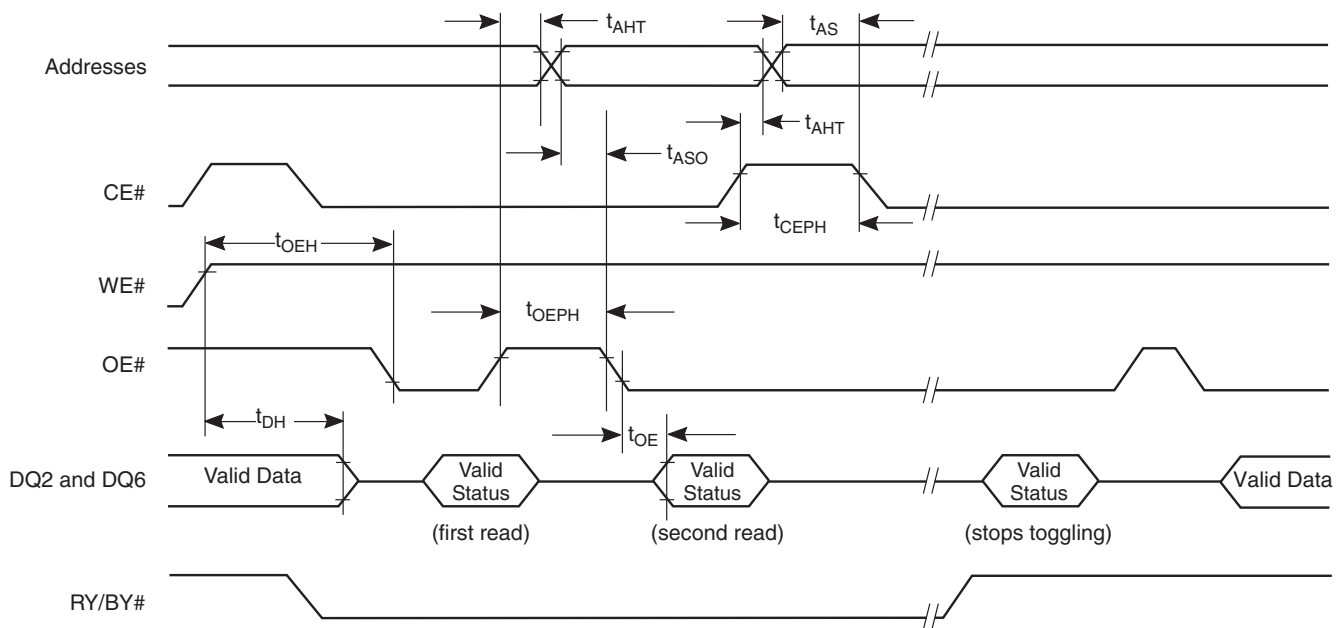

Note
A = Valid address; not required for DQ6. Illustration shows first two status cycle after command sequence, last status read cycle, and array data read cycle

Figure 11.14 DQ2 vs. DQ6
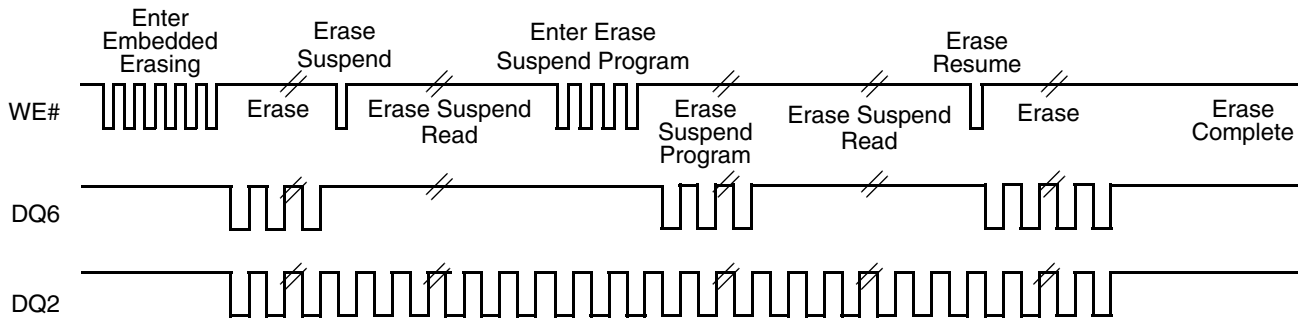

Note
DQ2 toggles only when read at an address within an erase-suspended sector. The system can use OE# or CE# to toggle DQ2 and DQ6.

11.7.4   S29GL-P Alternate CE# Controlled Erase and Program Operations

Table 11.7 S29GL-P Alternate CE# Controlled Erase and Program Operations

Parameter		Description (Notes)			Speed Options			Unit
JEDEC	**Std.**				**110**	**120**	**130**	
t_{AVAV}	t_{WC}	Write Cycle Time (Note 1)		Min	110 (Note 6)	120	130	ns
t_{AVWL}	t_{AS}	Address Setup Time		Min		0		ns
	t_{ASO}	Address Setup Time to OE# low during toggle bit polling		Min		15		ns
t_{ELAX}	t_{AH}	Address Hold Time		Min		45		ns
	t_{AHT}	Address Hold Time From CE# or OE# high during toggle bit polling		Min		0		ns
t_{DVEH}	t_{DS}	Data Setup Time		Min		45		ns
t_{EHDX}	t_{DH}	Data Hold Time		Min		0		ns
	t_{CEPH}	CE# High during toggle bit polling		Min		20		ns
	t_{OEPH}	OE# High during toggle bit polling		Min		20		ns
t_{GHEL}	t_{GHEL}	Read Recovery Time Before Write (OE# High to WE# Low)		Min		0		ns
t_{WLEL}	t_{WS}	WE# Setup Time		Min		0		ns
t_{EHWH}	t_{WH}	WE# Hold Time		Min		0		ns
t_{ELEH}	t_{CP}	CE# Pulse Width		Min		35		ns
t_{EHEL}	t_{CPH}	CE# Pulse Width High		Min		30		ns
t_{WHWH1}	t_{WHWH1}	Write Buffer Program Operation (Notes 2, 3)		Typ		480		µs
		Effective Write Buffer Program Operation (Notes 2, 4)	Per Word	Typ		15		µs
		Effective Accelerated Write Buffer Program Operation (Notes 2, 4)	Per Word	Typ		13.5		µs
		Program Operation (Note 2)	Word	Typ		60		µs
		Accelerated Programming Operation (Note 2)	Word	Typ		54		µs
t_{WHWH2}	t_{WHWH2}	Sector Erase Operation (Note 2)		Typ		0.5		sec

Notes

1. *Not 100% tested.*

2. *See the "AC Characteristics" section for more information.*

3. *For 1–32 words/1–64 bytes programmed.*

4. *Effective write buffer specification is based upon a 32-word/64-byte write buffer operation.*

5. *Unless otherwise indicated, AC specifications are tested with V_{IO} = 1.8 V and V_{CC} = 3.0 V*

6. *Write Cycle Time = Access Time at V_{CC}.*

**Figure 11.15** Alternate CE# Controlled Write (Erase/Program) Operation Timings
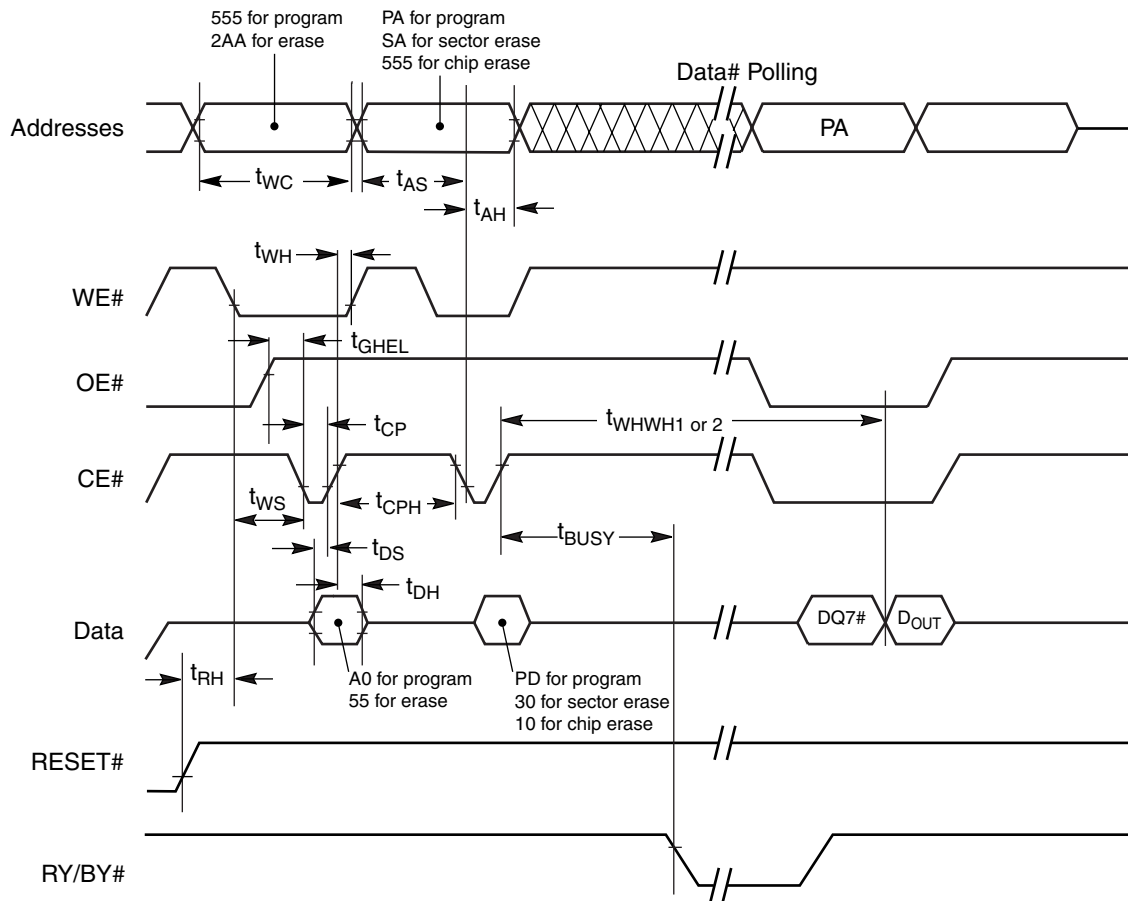

Notes

1. *Figure 11.15 indicates last two bus cycles of a program or erase operation.*

2. *PA = program address, SA = sector address, PD = program data.*

3. *DQ7# is the complement of the data written to the device. D_{OUT} is the data written to the device.*

4. *Waveforms are for the word mode.*

11.7.5 Erase And Programming Performance

Table 11.8 Erase And Programming Performance

Parameter		Typ (Note 1)	Max (Note 2)	Unit	Comments
Sector Erase Time		0.5	3.5	sec	Excludes 00h programming prior to erasure (Note 5)
Chip Erase Time	S29GL128P	64	256	sec	
	S29GL256P	128	512		
	S29GL512P	256	1024		
	S29GL01GP	512	2048		
Total Write Buffer Time (Note 3)		480		µs	Excludes system level overhead (Note 6)
Total Accelerated Write Buffer Programming Time (Note 3)		432		µs	
Chip Program Time (Note 4)	S29GL128P	123		sec	
	S29GL256P	246			
	S29GL512P	492			
	S29GL01GP	984			

Notes

1. Typical program and erase times assume the following conditions: 25°C, 3.6 V V_{CC}, 10,000 cycles, checkerboard pattern.

2. Under worst case conditions of -40°C, V_{CC} = 3.0 V, 100,000 cycles.

3. Effective write buffer specification is based upon a 32-word write buffer operation.

4. The typical chip programming time is considerably less than the maximum chip programming time listed, since most words program faster than the maximum program times listed.

5. In the pre-programming step of the Embedded Erase algorithm, all bits are programmed to 00h before erasure.

6. System-level overhead is the time required to execute the two- or four-bus-cycle sequence for the program command. See Tables 12.1–12.4.

11.7.6 TSOP Pin and BGA Package Capacitance

Table 1:

Parameter Symbol	Parameter Description	Test Setup		Typ	Max	Unit
C_{IN}	Input Capacitance	V_{IN} = 0	TSOP	6	7.5	pF
			BGA	4.2	5.0	pF
C_{OUT}	Output Capacitance	V_{OUT} = 0	TSOP	8.5	12	pF
			BGA	5.4	6.5	pF
C_{IN2}	Control Pin Capacitance	V_{IN} = 0	TSOP	7.5	9	pF
			BGA	3.9	4.7	pF

Notes

1. Sampled, not 100% tested.

2. Test conditions T_A = 25°C, f = 1.0 MHz.

12. Appendix

This section contains information relating to software control or interfacing with the Flash device. For additional information and assistance regarding software, see Section 5. For the latest information, explore the Spansion web site at www.spansion.com.

12.1 Command Definitions

Writing specific address and data commands or sequences into the command register initiates device operations. Tables 12.1–12.4 define the valid register command sequences. *Writing incorrect address and data values or writing them in the improper sequence can place the device in an unknown state.* A reset command is then required to return the device to reading array data.

Table 12.1 S29GL-P Memory Array Command Definitions, x16

Command (Notes)		Cycles	Bus Cycles (Notes 1–5)											
			First		Second		Third		Fourth		Fifth		Sixth	
			Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Read (6)		1	RA	RD										
Reset (7)		1	XXX	F0										
Autoselect (8,9)	Manufacturer ID	4	555	AA	2AA	55	555	90	X00	01				
	Device ID (8)	4	555	AA	2AA	55	555	90	X01	227E	X0E	(8)	X0F	(8)
	Sector Protect Verify (10)	4	555	AA	2AA	55	555	90	[SA]X02	(10)				
	Secure Device Verify (11)	4	555	AA	2AA	55	555	90	X03	(11)				
CFI Query (12)		1	55	98										
Program		4	555	AA	2AA	55	555	A0	PA	PD

Sector Erase		6	555	AA	2AA	55	555	80	555	AA	2AA	55	SA	30
Erase Suspend/Program Suspend (16)		1	XXX	B0										
Erase Resume/Program Resume (17)		1	XXX	30										
Secured Silicon Sector Entry		3	555	AA	2AA	55	555	88						
Secured Silicon Sector Exit (18)		4	555	AA	2AA	55	555	90	XX	00				

Legend

X = Don't care

RA = Address of the memory to be read.

RD = Data read from location RA during read operation.

PA = Address of the memory location to be programmed. Addresses latch on the falling edge of the WE# or CE# pulse, whichever happens later.

PD = Data to be programmed at location PA. Data latches on the rising edge of the WE# or CE# pulse, whichever happens first.

SA = Address of the sector to be verified (in autoselect mode) or erased. Address bits A_{max}–A16 uniquely select any sector.

WBL = Write Buffer Location. The address must be within the same write buffer page as PA.

WC = Word Count is the number of write buffer locations to load minus 1.

Notes

1. *See Table 7.1 on page 14 for description of bus operations.*

2. *All values are in hexadecimal.*

3. *All bus cycles are write cycles unless otherwise noted.*

4. *Data bits DQ15-DQ8 are don't cares for unlock and command cycles.*

5. *Address bits A_{MAX}:A16 are don't cares for unlock and command cycles, unless SA or PA required. (A_{MAX} is the Highest Address pin.).*

6. *No unlock or command cycles required when reading array data.*

7. The Reset command is required to return to reading array data when device is in the autoselect mode, or if DQ5 goes high (while the device is providing status data).

8. See Table 7.2 on page 17 for device ID values and definitions.

9. The fourth, fifth, and sixth cycles of the autoselect command sequence are read cycles.

10. The data is 00h for an unprotected sector and 01h for a protected sector. See "Autoselect Command Sequence" for more information. This is same as PPB Status Read except that the protect and unprotect statuses are inverted here.

11. The data value for DQ7 is "1" for a serialized, protected Secured Silicon Sector region and "0" for an unserialized, unprotected region. See Table 7.3 on page 17 for data and definitions.

12. Command is valid when device is ready to read array data or when device is in autoselect mode.

13. Command sequence returns device to reading array after being placed in a Write-to-Buffer-Abort state. Full command sequence is required if resetting out of abort while in Unlock Bypass mode.

14. The Unlock-Bypass command is required prior to the Unlock-Bypass-Program command.

15. The Unlock-Bypass-Reset command is required to return to reading array data when the device is in the unlock bypass mode.

16. The system can read and program/program suspend in non-erasing sectors, or enter the autoselect mode, when in the Erase Suspend mode. The Erase Suspend command is valid only during a sector erase operation.

17. The Erase Resume/Program Resume command is valid only during the Erase Suspend/Program Suspend modes.

18. The Exit command returns the device to reading the array.

Table 12.2 S29GL-P Sector Protection Command Definitions, x16

Command (Notes)		Cycles	Bus Cycles (Notes 1–5)											
			First/Seventh		Second		Third		Fourth		Fifth		Sixth	
			Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Lock Register	Command Set Entry	3	555	AA	2AA	55	555	40						
	Program (6)	2	XXX	A0	XXX	DATA								
	Read (6)	1	77h	DATA										
	Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Password Protection	Command Set Entry	3	555	AA	2AA	55	555	60						
	Password Program (9)	2	XXX	A0	PWA x	PWD x								
	Password Read (10)	4	00	PWD0	01	PWD 1	02	PWD 2	03	PWD 3				
	Password Unlock (10)	7	00	25	00	03	00	PWD 0	01	PWD 1	02	PWD 2	03	PWD 3
			00	29										
	Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Global Non-Volatile	PPB Command Set Entry	3	555	AA	2AA	55	555	C0						
	PPB Program (11, 12)	2	XXX	A0	SA	00								
	All PPB Erase (13)	2	XXX	80	00	30								
	PPB Status Read (12)	1	SA	RD (0)										
	PPB Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Global Non-Volatile Freeze	PPB Lock Command Set Entry	3	555	AA	2AA	55	555	50						
	PPB Lock Set (12)	2	XXX	A0	XXX	00								
	PPB Lock Status Read (12)	1	XXX	RD (0)										
	PPB Lock Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Volatile	DYB Command Set Entry	3	555	AA	2AA	55	555	E0						
	DYB Set (11, 12)	2	XXX	A0	SA	00								
	DYB Clear (12)	2	XXX	A0	SA	01								
	DYB Status Read (12)	1	SA	RD (0)										
	DYB Command Set Exit (7, 8)	2	XXX	90	XXX	00								

Legend

X = Don't care

RD(0) = Read data.

SA = Sector Address. Address bits A_{max}–A16 uniquely select any sector.

PWD = Password

PWD_x = Password word0, word1, word2, and word3.

Data = Lock Register Contents: PD(0) = Secured Silicon Sector Protection Bit, PD(1) = Persistent Protection Mode Lock Bit, PD(2) = Password Protection Mode Lock Bit.

Notes

1. See Table 7.1 on page 14 for description of bus operations.

2. All values are in hexadecimal.

3. All bus cycles are write cycles unless otherwise noted.

4. Data bits DQ15-DQ8 are don't cares for unlock and command cycles.

5. Address bits A_{MAX}:A16 are don't cares for unlock and command cycles, unless SA or PA required. (A_{MAX} is the Highest Address pin.)

6. All Lock Register bits are one-time programmable. Program state = "0" and the erase state = "1." The Persistent Protection Mode Lock Bit and the Password Protection Mode Lock Bit cannot be programmed at the same time or the Lock Register Bits Program operation aborts and returns the device to read mode. Lock Register bits that are reserved for future use default to "1's." The Lock Register is shipped out as "FFFF's" before Lock Register Bit program execution.

7. The Exit command returns the device to reading the array.

8. If any Command Set Entry command was written, an Exit command must be issued to reset the device into read mode.

9. For PWDx, only one portion of the password can be programmed per each "A0" command.

10. Note that the password portion can be entered or read in any order as long as the entire 64-bit password is entered or read.

11. If ACC = V_{HH}, sector protection matches when ACC = V_{IH}.

12. Protected State = "00h," Unprotected State = "01h."

13. The All PPB Erase command embeds programming of all PPB bits before erasure.

Table 12.3 S29GL-P Memory Array Command Definitions, x8

Command (Notes)		Cycles	Bus Cycles (Notes 1–5)											
			First		Second		Third		Fourth		Fifth		Sixth

Global Non-Volatile	All PPB Erase (13)	2	XXX	80	00	30								
Global Non-Volatile	PPB Status Read (12)	1	SA	RD(0)										
Global Non-Volatile	PPB Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Global Non-Volatile Freeze	PPB Lock Command Set Entry	3	AAA	AA	555	55	AAA	50						
Global Non-Volatile Freeze	PPB Lock Bit Set (12)	2	XXX	A0	XXX	00								
Global Non-Volatile Freeze	PPB Lock Status Read (12)	1	XXX	RD(0)										
Global Non-Volatile Freeze	PPB Lock Command Set Exit (7, 8)	2	XXX	90	XXX	00								
Volatile	DYB Command Set Entry	3	AAA	AA	555	55	AAA	E0						
Volatile	DYB Set (11, 12)	2	XXX	A0	SA	00								
Volatile	DYB Clear (12)	2	XXX	A0	SA	01								
Volatile	DYB Status Read (12)	1	SA	RD(0)										
Volatile	DYB Command Set Exit (7, 8)	2	XXX	90	XXX	00								

Legend

X = Don't care

RD(0) = Read data.

SA = Sector Address. Address bits A_{max}–A16 uniquely select any sector.

PWD = Password

PWD_x = Password word0, word1, word2, and word3.

Data = Lock Register Contents: PD(0) = Secured Silicon Sector Protection Bit, PD(1) = Persistent Protection Mode Lock Bit, PD(2) = Password Protection Mode Lock Bit.

Notes

1. See *Table 7.1 on page 14* for description of bus operations.

2. All values are in hexadecimal.

3. All bus cycles are write cycles unless otherwise noted.

4. Data bits DQ15-DQ8 are don't cares for unlock and command cycles.

5. Address bits A_{MAX}:A16 are don't cares for unlock and command cycles, unless SA or PA required. (A_{MAX} is the Highest Address pin.)

6. All Lock Register bits are one-time programmable. Program state = "0" and the erase state = "1". The Persistent Protection Mode Lock Bit and the Password Protection Mode Lock Bit cannot be programmed at the same time or the Lock Register Bits Program operation aborts and returns the device to read mode. Lock Register bits that are reserved for future use default to "1's." The Lock Register is shipped out as "FFFF's" before Lock Register Bit program execution.

7. The Exit command returns the device to reading the array.

8. If any Command Set Entry command was written, an Exit command must be issued to reset the device into read mode.

9. For PWDx, only one portion of the password can be programmed per each "A0" command.

10. Note that the password portion can be entered or read in any order as long as the entire 64-bit password is entered or read.

11. If ACC = V_{HH}, sector protection matches when ACC = V_{IH}.

12. Protected State = "00h," Unprotected State = "01h."

13. The All PPB Erase command embeds programming of all PPB bits before erasure.

12.2   Common Flash Memory Interface

The Common Flash Interface (CFI) specification outlines device and host system software interrogation handshake, which allows specific vendor-specified software algorithms to be used for entire families of devices. Software support can then be device-independent, JEDEC ID-independent, and forward- and backward-compatible for the specified flash device families. Flash vendors can standardize their existing interfaces for long-term compatibility.

This device enters the CFI Query mode when the system writes the CFI Query command, 98h, to address 55h any time the device is ready to read array data. The system can read CFI infomation at the addresses given in Tables 12.6–12.8). All reads outside of the CFI address range, returns non-valid data. Reads from other sectors are allowed, writes are not. To terminate reading CFI data, the system must write the reset command.

The system can also write the CFI query command when the device is in the autoselect mode. The device enters the CFI query mode, and the system can read CFI data at the addresses given in Tables 12.6–12.8. The system must write the reset command to return the device to reading array data.

The following is a C source code example of using the CFI Entry and Exit functions. Refer to the *Spansion Low Level Driver User's Guide* (available on www.spansion.com) for general information on Spansion Flash memory software development guidelines.

```
/* Example: CFI Entry command */
  *( (UINT16 *)base_addr + 0x55 ) = 0x0098;   /* write CFI entry command         */

/* Example: CFI Exit command  */
  *( (UINT16 *)base_addr + 0x000 ) = 0x00F0;   /* write cfi exit command          */
```

For further information, please refer to the CFI Specification (see JEDEC publications JEP137-A and JESD68.01and CFI Publication 100). Please contact your sales office for copies of these documents.

Table 12.5 CFI Query Identification String

Addresses (x16)	Addresses (x8)	Data	Description
10h 11h 12h	20h 22h 24h	0051h 0052h 0059h	Query Unique ASCII string "QRY"
13h 14h	26h 28h	0002h 0000h	Primary OEM Command Set
15h 16h	2Ah 2Ch	0040h 0000h	Address for Primary Extended Table
17h 18h	2Eh 30h	0000h 0000h	Alternate OEM Command Set (00h = none exists)
19h 1Ah	32h 34h	0000h 0000h	Address for Alternate OEM Extended Table (00h = none exists)

Table 12.6 System Interface String

Addresses (x16)	Addresses (x8)	Data	Description
1Bh	36h	0027h	V_{CC} Min. (write/erase) D7–D4: volt, D3–D0: 100 mV
1Ch	38h	0036h	V_{CC} Max. (write/erase) D7–D4: volt, D3–D0: 100 mV
1Dh	3Ah	0000h	V_{PP} Min. voltage (00h = no V_{PP} pin present)
1Eh	3Ch	0000h	V_{PP} Max. voltage (00h = no V_{PP} pin present)
1Fh	3Eh	0006h	Typical timeout per single byte/word write 2^N µs
20h	40h	0006h	Typical timeout for Min. size buffer write 2^N µs (00h = not supported)
21h	42h	0009h	Typical timeout per individual block erase 2^N ms
22h	44h	0013h	Typical timeout for full chip erase 2^N ms (00h = not supported)
23h	46h	0003h	Max. timeout for byte/word write 2^N times typical
24h	48h	0005h	Max. timeout for buffer write 2^N times typical
25h	4Ah	0003h	Max. timeout per individual block erase 2^N times typical
26h	4Ch	0002h	Max. timeout for full chip erase 2^N times typical (00h = not supported)

Table 12.7 Device Geometry Definition

Addresses (x16)	Addresses (x8)	Data	Description
27h	4Eh	001Bh 001Ah 0019h 0018h	Device Size = 2^N byte 1B = 1 Gb, 1A= 512 Mb, 19 = 256 Mb, 18 = 128 Mb
28h 29h	50h 52h	0002h 0000h	Flash Device Interface description (refer to CFI publication 100)
2Ah 2Bh	54h 56h	0006h 0000h	Max. number of byte in multi-byte write = 2^N (00h = not supported)
2Ch	58h	0001h	Number of Erase Block Regions within device (01h = uniform device, 02h = boot device)
2Dh 2Eh 2Fh 30h	5Ah 5Ch 5Eh 60h	00xxh 000xh 0000h 000xh	Erase Block Region 1 Information (refer to the CFI specification or CFI publication 100) 00FFh, 0003h, 0000h, 0002h =1 Gb 00FFh, 0001h, 0000h, 0002h = 512 Mb 00FFh, 0000h, 0000h, 0002h = 256 Mb 007Fh, 0000h, 0000h, 0002h = 128 Mb
31h 32h 33h 34h	60h 64h 66h 68h	0000h 0000h 0000h 0000h	Erase Block Region 2 Information (refer to CFI publication 100)
35h 36h 37h 38h	6Ah 6Ch 6Eh 70h	0000h 0000h 0000h 0000h	Erase Block Region 3 Information (refer to CFI publication 100)
39h 3Ah 3Bh 3Ch	72h 74h 76h 78h	0000h 0000h 0000h 0000h	Erase Block Region 4 Information (refer to CFI publication 100)

Table 12.8 Primary Vendor-Specific Extended Query

Addresses (x16)	Addresses (x8)	Data	Description
40h 41h 42h	80h 82h 84h	0050h 0052h 0049h	Query-unique ASCII string "PRI"
43h	86h	0031h	Major version number, ASCII
44h	88h	0033h	Minor version number, ASCII
45h	8Ah	0014h	Address Sensitive Unlock (Bits 1-0) 0 = Required, 1 = Not Required Process Technology (Bits 7-2) 0101b = 90 nm MirrorBit
46h	8Ch	0002h	Erase Suspend 0 = Not Supported, 1 = To Read Only, 2 = To Read & Write
47h	8Eh	0001h	Sector Protect 0 = Not Supported, X = Number of sectors in per group
48h	90h	0000h	Sector Temporary Unprotect 00 = Not Supported, 01 = Supported
49h	92h	0008h	Sector Protect/Unprotect scheme 0008h = Advanced Sector Protection
4Ah	94h	0000h	Simultaneous Operation 00 = Not Supported, X = Number of Sectors
4Bh	96h	0000h	Burst Mode Type 00 = Not Supported, 01 = Supported
4Ch	98h	0002h	Page Mode Type 00 = Not Supported, 01 = 4 Word Page, 02 = 8 Word Page
4Dh	9Ah	00B5h	ACC (Acceleration) Supply Minimum 00h = Not Supported, D7-D4: Volt, D3-D0: 100 mV
4Eh	9Ch	00C5h	ACC (Acceleration) Supply Maximum 00h = Not Supported, D7-D4: Volt, D3-D0: 100 mV
4Fh	9Eh	00xxh	WP# Protection 04h = Uniform sectors bottom WP# protect, 05h = Uniform sectors top WP# protect
50h	A0h	0001h	Program Suspend 00h = Not Supported, 01h = Supported

13. Revision Summary

Section	Description
Revision A0 (October 29, 2004)	
	Initial Release.
Revision A1 (October 20, 2005)	
Global	Revised all sections of document.
Revision A2 (October 19, 2006)	
Global	Revised all sections of document. Reformatted document to new template. Changed speed options for S29GL01GP.
Revision A3 (November 21, 2006)	
AC Characteristics	*Erase and Program Operations table:* Changed t_{BUSY} to a maximum specification.

Colophon

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for any use that includes fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for any use where chance of failure is intolerable (i.e., submersible repeater and artificial satellite). Please note that Spansion will not be liable to you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products. Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions. If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the US Export Administration Regulations or the applicable laws of any other country, the prior authorization by the respective government entity will be required for export of those products.

Trademarks and Notice
