PCI EXPRESS™ CLOCK GENERATOR

ICS841S04I

General Description

The ICS841S04I is a PLL-based clock generator specifically designed for PCI_Express™Clock Generation applications. This device generates a 100MHz HCSL clock. The device offers a HCSL (Host Clock Signal Level) clock output from a clock input reference of 25MHz. The input reference may be derived from an external source or by the addition of a 25MHz crystal to the on-chip crystal oscillator. An external reference may be applied to the XTAL_IN pin with the XTAL_OUT pin left floating.

The device offers spread spectrum clock output for reduced EMI applications. An I²C bus interface is used to enable or disable spread spectrum operation as well as select either a down spread value of -0.35% or -0.5%.

The ICS841S04I is available in both standard and lead-free 24-Lead TSSOP packages.

Features

- Four 0.7V current mode differential HCSL output pairs
- Crystal oscillator interface, 25MHz
- Output frequency: 100MHz
- RMS period jitter: 3ps (maximum)
- Output skew: 70ps (maximum)
- Cycle-to-cyle jitter: 35ps (maximum)
- I²C support with readback capabilities up to 400kHz
- Spread Spectrum for electromagnetic interference (EMI) reduction
- 3.3V operating supply mode
- -40°C to 85°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting upon power-up, and therefore, use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 3A.*

The block write and block read protocol is outlined in *Table 3B*, while *Table 3C* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

APPLICATION INFORMATION

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS841S04I provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD_REF}, $V_{DD\_SRC,}$ and V_{DDA} should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a 10Ω resistor along with a 10µF and a .01µF bypass capacitor should be connected to each V_{DDA}. The 10Ω resistor can also be replaced by a ferrite bead.

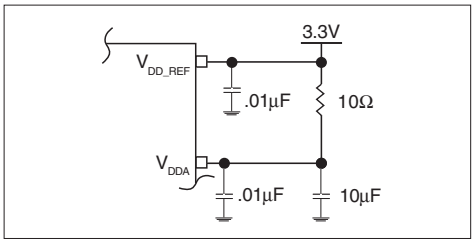

FIGURE 1. POWER SUPPLY FILTERING

USING THE ON-BOARD CRYSTAL OSCILLATOR

The ICS841S04I features a fully integrated Pierce oscillator to minimize system implementation costs. The ICS841S04I may be operated with a 25MHz crystal and without additional components. Recommended operation for the crystal should be of a parallel resonant type and a load specification of C_L = 18pF. See Table 7 for complete crystal specifications.

If more precise frequency control is desired, the addition of capacitors from each of the XTAL_IN and XTAL_OUT pins to ground may be used to trim the frequency as shown in Figure 2.

TABLE 7. RECOMMENDED CRYSTAL SPECIFICATIONS

Parameter	Value
Crystal Cut	Fundamental AT Cut
Resonance	Parallel Resonance
Shunt Capacitance (C_L)	5-7pF
Load Capacitance (C_O)	18pF
Equivalent Series Resistance (ESR)	20-50Ω

The crystal and optional trim capacitors should be located as close to the ICS841S04I XTAL_IN and XTAL_OUT pins as possible to avoid any board level parasitic.

Recommendations for Unused Input and Output Pins

Inputs:

LVCMOS Control Pins

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs:

Differential Output s

All unused differential outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

Output Driver Current

The ICS841S04I outputs are HCSL current drive with the current being set with a resistor from I_{REF} to ground. For a 50Ω pc board trace, the drive current would typically be set with a R_{REF} of 475Ω which products an I_{REF} of 2.32mA. The I_{REF} is multiplied by a current mirror to an output drive of 6*2.32mA or 13.92mA. See *Figure 3* for current mirror and output drive details.

RECOMMENDED TERMINATION

Figure 4A is the recommended termination for applications which require the receiver and driver to be on a separate PCB. All traces should be 50Ω impedance.

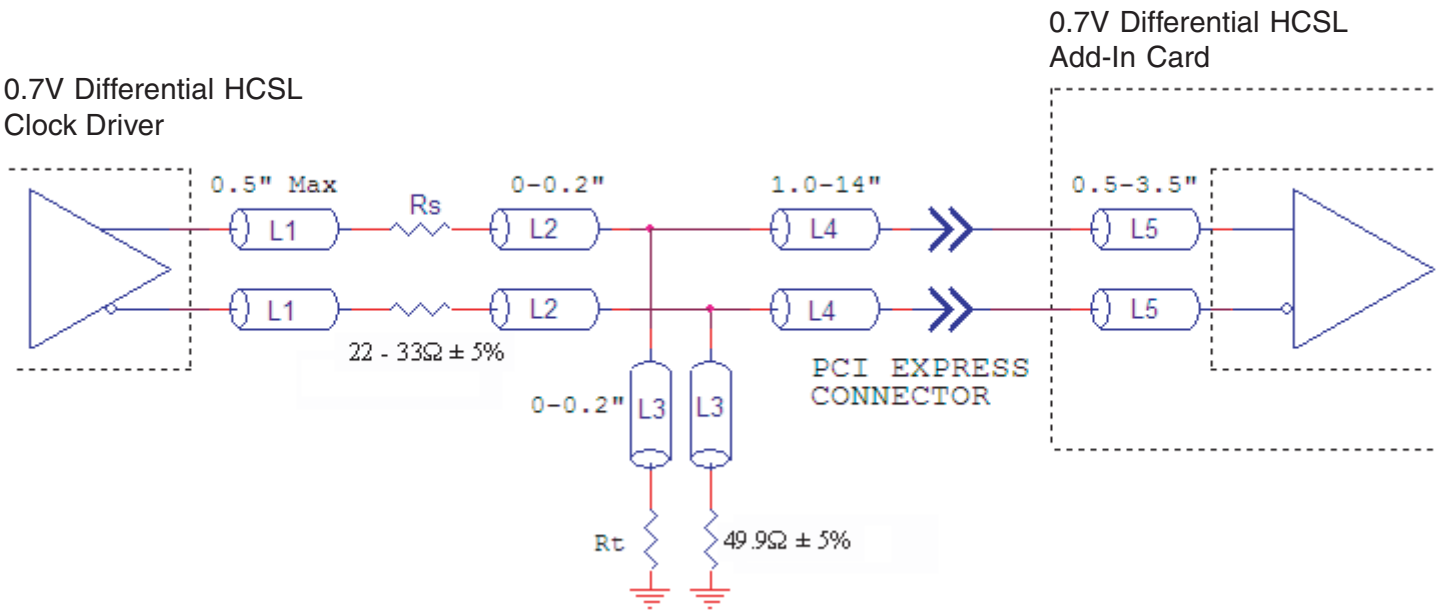

FIGURE 4A. RECOMMENDED TERMINATION

Figure 4B is the recommended termination for applications which require a point to point connection and contain the driver and receiver on the same PCB. All traces should all be 50Ω impedance.
