

## GENERAL DESCRIPTION

The ICS830584I is a low skew, general purpose PCI-X 1-to-4 Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. Guaranteed output and part-to-part skew characteristics make the ICS830584I ideal for those clock distribution applications demanding well defined performance and repeatability. The ICS830584I is designed and characterized from -40°C to 85°C for industrial applications and is packaged in an 8 TSSOP package.

## FEATURES

- General purpose and PCI-X 1:4 clock buffer
- Four single-ended LVCMOS/LVTTL clock outputs
- One single-ended LVCMOS/LVTTL clock input
- Maximum output frequency: 140MHz
- Output enable control (outputs disabled in logic low state)
- Output skew: 100ps (maximum)
- Part-to-part skew: 400ps (maximum)
- Additive phase jitter, RMS: 0.15ps (typical)
- Space-saving 8 lead TSSOP package
- Full 3.3V operating supply mode
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) packages

NOTE 1: Switching characteristics over recommended ranges of supply voltages and operating free-air temperature,  $C_L = 10pF$ ,  $V_{DD} = 3.3V \pm 0.3V$ .

NOTE 2: Measured from  $V_{DD}/2$  of the input to  $V_{DD}/2$  of the output.

NOTE 3: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at  $V_{DD}/2$ .

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 5: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of input on each device, the output is measured at  $V_{DD}/2$ .

## ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz

band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the

device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

### RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

#### INPUTS:

##### OE INPUT

The OE pin must be tied either HIGH or LOW. Do not leave floating.

#### OUTPUTS:

##### LVC MOS OUTPUTS

All unused LVC MOS outputs can be left floating. We recommend that there is no trace attached.
