AMD-K7™ System Clock Chip

Recommended Application:

AMD-K7 (AMD 750, Irongate Chipset)

Output Features:

- 3 differential pair open drain CPU clocks (1.5V external pull-up; up to 150MHz achieviable through I^2C)
- 2 - AGPCLK @ 3.3V
- 8 - PCI @3.3V, including 1 free running
- 1 - 48MHz @ 3.3V
- 1 - 24/48MHz @ 3.3V
- 2 - REF @3.3V, 14.318MHz.

Features:

- Up to 150MHz frequency support
- Support power management: CPU, PCI, stop and Power down Mode from I^2C programming.
- Spread spectrum for EMI control +/-0.25% center spread
- Uses external 14.318MHz crystal
- FS pins for frequency select

Key Specifications:

- CPU – CPU: <200ps
- AGP-AGP: <250ps
- PCI – PCI: <500ps
- CPU - SDRAM_OUT: |250ps|
- CPU-AGP: |250ps|

Pin Configuration

VDD, GND = PLL Core

Pin Descriptions

PIN NUMBER	PIN NAME	TYPE	DESCRIPTION
2,1	FS (1:0)	IN	Frequency Select pins, has pull-up to VDD
	REF (1:0)	OUT	14.318MHz clock output
3, 6, 21, 25, 33, 38, 41, 47	GND	PWR	Ground
4	X1	IN	XTAL_IN 14.318MHz Crystal input, has internal 33pF load cap and feed back resistor from X2
5	X2	OUT	XTAL_OUT Crystal output, has internal load cap 33pF
7	PCICLK_F	OUT	Free Running PCI output. Not affected by the PCI_STOP# input.
17, 16, 14, 13, 11, 10, 8	PCICLK (6:0)	OUT	PCI clock outputs. TTL compatible 3.3V
9, 15	VDDPCI	PWR	Power for PCICLK outputs, nominally 3.3V
18	VDDAGP	PWR	Power for AGP outputs, nominally 3.3V
20, 19	AGP (1:0)	OUT	AGP outputs defined as 2X PCI. These may not be stopped.
34	VDD	PWR	Isolated power for core, nominally 3.3V
22	VDD48	PWR	Power for 48MHz and 24MHz outputs nominally 3.3V
23	48MHz	OUT	48MHz output
24	SEL24-48#	IN	Selects 24 or 48MHz output for pin 24 Low = 48MHz High = 24MHz
	24-48MHz	OUT	Fixed clock out selectable through SEL24-48#
26	SCLK	IN	Clock pin of I²C circuitry 5V tolerant
27	SDATA	I/O	Data pin for I²C circuitry 5V tolerant
28	FS2	IN	Frequency Select pin, has pull-up to VDD
29	SPREAD#	IN	Enables Spread Spectrum feature when LOW. Center spread of +/- 0.25%.
30	PD#	IN	Powers down chip, active low. Internal PLL & all outputs are disabled.
31	CPU_STOP#	IN	Halts CPUCLKs. CPUCLKT is driven LOW wheras CPUCLKC is driven HIGH when this pin is asserted (Active LOW).
32	PCI_STOP#	IN	Halts PCI Bus at logic "0" level when driven low. PCICLK_F is not affected by this pin
46	SDRAM_OUT	OUT	Reference clock for SDRAM zero delay buffer
35, 44	RESERVED	N/C	Future CPU power rail
42, 39, 36	CPUCLKT (2:0)	OUT	"True" clocks of differential pair CPU outputs. These open drain outputs need an external 1.5V pull-up.
43, 40, 37	CPUCLKC (2:0)	OUT	"Complementory" clocks of differential pair CPU output. These open drain outputs need an external 1.5V pull_up.
45	VDDSD	PWR	Power for SDRAM_OUT pin. Norminally 3.3V
48	VDDREF	PWR	Power for REF, X1, X2, nominally 3.3V

Absolute Maximum Ratings

Supply Voltage . . . . 5.5 V

Logic Inputs . . . . GND –0.5 V to V_{DD} +0.5 V

Ambient Operating Temperature . . . . 0°C to +70°C

Storage Temperature . . . . –65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Electrical Characteristics - Input/Supply/Common Output Parameters

T_A = 0 - 70C; Supply Voltage V_{DD} = V_{DDL} = 3.3 V +/-5% (unless otherwise stated)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input High Voltage	V_{IH}		2		V_{DD}+0.3	V
Input Low Voltage	V_{IL}		V_{SS}-0.3		0.8	V

Jitter, Cycle-to-Cycle, fixed clock	$t_{jcyc-cyc5, fixed}$[1]	V_T = 50%		248	500	ps

[1]Guaranteed by design, not 100% tested in production.

Electrical Characteristics - CPUCLK (Open Drain)

T_A = 0 - 70º C; V_{DD} = 3.3 V +/-5%; C_L = 20 pF (unless otherwise stated).

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Output Impedance	Z_O[1]	V_O = V_X			60	Ω
Output High Voltage	V_{OH2B}	Termination to $V_{pull-up (external)}$	1		1.2	V
Output Low Voltage	V_{OL2B}	Termination to $V_{pull-up (external)}$			0.4	V
Output Low Current	I_{OL2B}	V_{OL} = 0.3 V	18			mA
Rise Time	t_{r2B}	V_{OL} = 20%, V_{OH} = 80%		2.4	2.6	ns
Fall Time	t_{f2B}	V_{OH} = 80%, V_{OL} = 20%		1.2	2.6	ns
Duty Cycle	d_{t2B}[1]	V_T = 50%	42	45.4	52	%
Differential Voltage-AC	V_{DIF}[1]	Note 2	0.4	1.03	$V_{pull-up (external)}$ + 0.6	V
Differential Voltage-DC	V_{DIF}[1]	Note 2	0.2		$V_{pull-up (external)}$ + 0.6	V
Differential Crossover Voltage	V_X[1]	Note 3	400	412	950	mV
Skew	t_{sk2B}[1]	V_T = 50%		55	200	ps
Jitter, Absolute	t_{jabs2B}[1]	V_T = 50%	-250	120	+250	ps
Jitter, Cycle-to-cycle	$t_{jcyc-cyc2B}$[1]	V_T = V_X		99	250	ps

Notes:

1 - Guaranteed by design, not 100% tested in production.

2 - V_{DIF} specifies the minimum input differential voltages (V_{TR}-V_{CP}) required for switching, where V_{TR} is the "true" input level and VCP is the "complement" input level.

3 - Vpull-up(external) = 1.5V, Min = ($V_{pull-up(external)}$/2) - 150mV; Max = ($V_{pull-up(external)}$/2) + 150mV

ICS9248-153

Electrical Characteristics - PCICLK

General I^{2}C serial interface information

The information in this section assumes familiarity with I^{2}C programming.
For more information, contact ICS for an I^{2}C programming application note.

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2 $_{(H)}$
- ICS clock will *acknowledge*
- Controller (host) sends a dummy command code
- ICS clock will *acknowledge*
- Controller (host) sends a dummy byte count
- ICS clock will *acknowledge*
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will *acknowledge* each byte *one at a time*.
- Controller (host) sends a Stop bit

How to Write:	
Controller (Host)	**ICS (Slave/Receiver)**
Start Bit	
Address D2$_{(H)}$	
	ACK
Dummy Command Code	
	ACK
Dummy Byte Count	
	ACK
Byte 0	
	ACK
Byte 1	
	ACK
Byte 2	
	ACK
Byte 3	
	ACK
Byte 4	
	ACK
Byte 5	
	ACK
Stop Bit	

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3 $_{(H)}$
- ICS clock will *acknowledge*
- ICS clock will send the *byte count*
- Controller (host) acknowledges
- ICS clock sends first byte *(Byte 0) through byte 5*
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

How to Read:	
Controller (Host)	**ICS (Slave/Receiver)**
Start Bit	
Address D3$_{(H)}$	
	ACK
	Byte Count
ACK	
	Byte 0
ACK	
	Byte 1
ACK	
	Byte 2
ACK	
	Byte 3
ACK	
	Byte 4
ACK	
	Byte 5
ACK	
Stop Bit	

Notes:

1. The ICS clock generator is a slave/receiver, I^{2}C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol**.
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I^{2}C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Third party brands and names are the property of their respective owners.

9

ICS9248-153

Shared Pin Operation - Input/Output Pins

The I/O pins designated by (input/output) on the ICS9248-153 serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

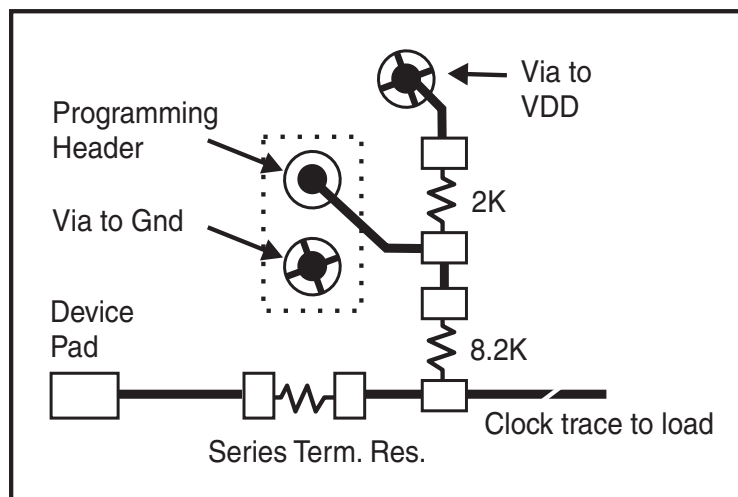

Fig. 1

10

General Description

The **ICS9248-153** is a main clock synthesizer chip for AMD-K7 based systems. This provides all clocks required for such a system when used with a Zero Delay Buffer Chip such as the ICS9179-06.

Spread spectrum may be enabled through I^{2}C programming. Spread spectrum typically reduces system EMI by 8dB to 10dB. This simplifies EMI qualification without resorting to board design iterations or costly shielding. The ICS9248-153 employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

Serial programming I^{2}C interface allows changing functions, stop clock programming and frequency selection.

CPU_STOP# Timing Diagram

CPU_STOP# is an asynchronous input to the clock synthesizer. It is used to turn off the CPUCLKs for low power operation. CPU_STOP# is synchronized by the **ICS9248-153**. All other clocks will continue to run while the CPUCLKs clocks are disabled. The CPUCLKs will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPUCLK on latency is less than 4 CPUCLKs and CPUCLK off latency is less than 4 CPUCLKs.

Notes:

1. All timing is referenced to the internal CPUCLK.
2. CPU_STOP# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPUCLKs inside the **ICS9248-153**.
3. All other clocks continue to run undisturbed.
4. PD# and PCI_STOP# are shown in a high (true) state.

Third party brands and names are the property of their respective owners.

PCI_STOP# Timing Diagram

PCI_STOP# is an asynchronous input to the **ICS9248-153**. It is used to turn off the PCICLK (0:5) clocks for low power operation. PCI_STOP# is synchronized by the **ICS9248-153** internally. PCICLK (0:5) clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK (0:5) clock on latency cycles are only one rising PCICLK clock off latency is one PCICLK clock.

Notes:

1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device.)
2. PCI_STOP# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248.
3. All other clocks continue to run undisturbed.
4. PD# and CPU_STOP# are shown in a high (true) state.

PD# Timing Diagram

The power down selection is used to put the part into a very low power state without turning off the power to the part. PD# is an asynchronous active low input. This signal needs to be synchronized internal to the device prior to powering down the clock synthesizer.

Internal clocks are not running after the device is put in power down. When PD# is active low all clocks need to be driven to a low value and held prior to turning off the VCOs and crystal. The power up latency needs to be less than 3 mS. The power down latency should be as short as possible but conforming to the sequence requirements shown below. PCI_STOP# and CPU_STOP# are considered to be don't cares during the power down operations. The REF and 48MHz clocks are expected to be stopped in the LOW state as soon as possible. Due to the state of the internal logic, stopping and holding the REF clock outputs in the LOW state may require more than one clock cycle to complete.

Notes:
1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248-153 device).
2. As shown, the outputs Stop Low on the next falling edge after PD# goes low.
3. PD# is an asynchronous input and metastable conditions may exist. This signal is synchronized inside this part.
4. The shaded sections on the VCO and the Crystal signals indicate an active clock.
5. Diagrams shown with respect to 133MHz. Similar operation when CPU is 100MHz.
