SY898530U

500MHz 1:16 3.3V-to-2.5V LVPECL Fanout Buffer

General Description

The SY898530U is a 1:16 Fanout buffer which can accept most standard differential logic levels and outputs the signal as a differential 2.5V LVPECL signal. The part can amplify input signals as small as 150mVpp to the full LVPECL output swing. The SY898530U is well suited for clock distribution applications which demand versatility and low-skew performance. It is pin-to-pin compatible with IDT's ICS8530 fanout buffer.

The SY898530U operates from a 3.3V ±5% core power supply and a 2.5V ±5% output supply and is guaranteed over the full commercial temperature range (0°C to +70°C). It is available in a 48-pin TQFP lead-free package.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. ψ_{JB} and θ_{JA} values are determined for a 4-layer board in still-air number, unless otherwise stated. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
