## 5V Triple PECL Input to LVPECL Output Translator

### Description

The MC100LVEL92 is a triple PECL input to LVPECL output translator. The device receives standard PECL signals and translates them to differential LVPECL output signals.

To accomplish the PECL to LVPECL level translation, the MC100LVEL92 requires three power rails. The  $V_{CC}$  supply is to be connected to the standard 5 V PECL supply, the  $LV_{CC}$  supply is to be connected to the 3.3 V LVPECL supply, and Ground is connected to the system ground plane. Both the  $V_{CC}$  and  $LV_{CC}$  should be bypassed to ground with 0.01  $\mu\text{f}$  capacitors.

The PECL  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu\text{F}$  capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Input parameters vary 1:1 with  $V_{CC}$ .  $V_{CC}$  can vary 4.5 V to 5.5 V.
2.  $V_{IHCMR}$  min varies 1:1 with GND.  $V_{IHCMR}$  max varies 1:1 with  $V_{CC}$ . The  $V_{IHCMR}$  range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{ppmin}$  and 1.0 V.
