## FEATURES

■ Precision 1:4, LVPECL fanout buffer
■ Guaranteed AC performance over temperature/ voltage:

- $>4 \mathrm{GHz} \mathrm{f}_{\mathrm{MAX}}$ (clock)
- <100ps $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$ Times
- <300ps $\mathrm{t}_{\mathrm{pd}}$
- <15ps max skew

■ Low jitter performance

- <10ps ${ }_{\text {pp }}$ total jitter (clock)
- $<1 \mathrm{ps}_{\mathrm{rms}}$ random jitter (data)
- $<10 \mathrm{ps}_{\mathrm{pp}}$ deterministic jitter (data)
$\square$ Accepts an input signal as low as 100 mV
- Unique input termination and VT pin accepts DC-coupled and AC-coupled differential inputs: LVPECL, LVDS, and CML
■ 100k LVPECL compatible 800 mV swing output
■ Power supply $2.5 \mathrm{~V} \pm 5 \%$ and $3.3 \mathrm{~V} \pm 10 \%$
- $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range

■ Available in 16-pin ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ ) MLF ${ }^{\circledR}$ package

## APPLICATIONS

■ All SONET and All GigE clock distribution

- Fibre Channel clock and data distribution

■ Backplane distribution
■ High-end, low skew, multiprocessor synchronous clock distribution

## FUNCTIONAL BLOCK DIAGRAM

Precision Edge ${ }^{\circledR}$

## DESCRIPTION

The SY58021U is a $2.5 \mathrm{~V} / 3.3 \mathrm{~V}$ precision, high-speed, fully differential 1:4 LVPECL fanout buffer. Optimized to provide four identical output copies with less than 15ps of skew and less than 10pspp total jitter, the SY58021U can process clock signals as fast as 4 GHz .

The differential input includes Micrel's unique, 3-pin input termination architecture interfaces to differential LVPECL, CML, and LVDS signals (AC- or DC-coupled) as small as 100 mV without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an on-board output reference voltage ( $\mathrm{V}_{\text {REF }}$ $\left.\mathrm{AC}^{( }\right)$is provided to bias the VT pin. The outputs are 100k LVPECL compatible, with extremely fast rise/fall times guaranteed to be less than 100ps.

The SY58021U operates from a $2.5 \mathrm{~V} \pm 5 \%$ supply or $3.3 \mathrm{~V} \pm 10 \%$ supply and is guaranteed over the full industrial temperature range $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$. For applications that require faster rise/fall times, or greater bandwidth, consider the SY58022U 1:4 fanout buffer with 400 mV LVPECL output swing, or the SY58020U 1:4 CML fanout buffer. The SY58021U is part of Micrel's high-speed, Precision Edge ${ }^{\circledR}$ product line.

All support documentation can be found on Micrel's web site at www.micrel.com.

## PACKAGE/ORDERING INFORMATION

16-Pin MLF ${ }^{\circledR}$ (MLF-16)

Ordering Information ${ }^{(1)}$

| Part Number | Package <br> Type | Operating <br> Range | Package <br> Marking | Lead <br> Finish |
| :--- | :---: | :---: | :---: | :---: |
| SY58021UMI | MLF-16 | Industrial | 021 U | Sn-Pb |
| SY58021UMITR $^{(2)}$ | MLF-16 | Industrial | 021 U | Sn-Pb |
| SY58021UMG $^{(3)}$ | MLF-16 | Industrial | 021 U with <br> Pb-Free bar-line indicator | Pb-Free <br> NiPdAu |
| SY58021UMGTR $^{(2,3)}$ | MLF-16 | Industrial | 021 U with <br> Pb-Free bar-line indicator | Pb-Free <br> NiPdAu |

## Notes:

1. Contact factory for die availability. Dice are guaranteed at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, DC electricals only.
2. Tape and Reel.
3. Pb -Free package recommended for new designs.

## PIN DESCRIPTION

| Pin Number | Pin Name | Pin Function |
| :---: | :---: | :---: |
| 1, 4 | IN, /IN | Differential Input: This input pair receives the signal to be buffered. Each pin of this pair internally terminates with $50 \Omega$ to the VT pin. Note that this input will default to an indeterminate state if left open. See "Input Interface Applications" section. |
| 2 | VT | Input Termination Center-Tap: Each input terminates to this pin. The $\mathrm{V}_{\mathrm{T}}$ pin provides a center-tap for each input (IN, /IN) to the termination network for maximum interface flexibility. See "Input Interface Applications" section. |
| 3 | VREF-AC | Reference Output Voltage: This output biases to $\mathrm{V}_{\mathrm{CC}}-1.2 \mathrm{~V}$. It is used when AC-coupling to differential inputs. Connect $\mathrm{V}_{\text {REF-AC }}$ directly to the VT pin. Bypass with $0.01 \mu \mathrm{~F}$ low ESR capacitor to $\mathrm{V}_{\mathrm{CC}}$. See "Input Interface Applications" section. |
| 8, 13 | VCC | Positive Power Supply: Bypass with $0.1 \mu \mathrm{~F} / / 0.01 \mu \mathrm{~F}$ low ESR capacitors as close to the $\mathrm{V}_{\mathrm{CC}}$ pins as possible. |
| 5,16 | GND, Exposed Pad | Ground. Exposed pad must be connected to a ground plane that is the same potential as the ground pin. |
| $\begin{gathered} 14,15 \\ 11,12 \\ 9,10 \\ 6,7 \end{gathered}$ | $\begin{aligned} & \text { /Q0, Q0, } \\ & \text { /Q1, Q1, } \\ & \text { /Q2, Q2, } \\ & \text { /Q3, Q3 } \end{aligned}$ | LVPECL Differential Output Pairs: Differential buffered output copy of the input signal. The output swing is typically 800 mV Proper termination is $50 \Omega$ to $\mathrm{V}_{\mathrm{CC}}-2 \mathrm{~V}$ at the receiving end. Unused output pairs may be left floating with no impact on jitter or skew. See "LVPECL Output Termination" section. |

| $\mathrm{V}_{\text {DIFF_OUT }}$ | Differential Output Voltage Swing | see Figure 1b. | 1100 | 1560 | 2100 | mV |

## Notes:

1. Permanent device damage may occur if ratings in the "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied for conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.
4. Due to the limited drive capability, use for input of the same package only.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. $\mathrm{V}_{\mathrm{IH}}(\min )$ not lower than 1.2 V .

## AC ELECTRICAL CHARACTERISTICS

$\mathrm{V}_{\mathrm{CC}}=2.5 \mathrm{~V} \pm 5 \%$ or $3.3 \mathrm{~V} \pm 10 \% ; \mathrm{R}_{\mathrm{L}}=50 \Omega$ to $\mathrm{V}_{\mathrm{CC}}-2 \mathrm{~V} ; \mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$, unless otherwise stated.

|  |  | Note 12 | 2.5Gbps - 3.2Gbps |  |  | 10 | pspp |
| $\mathrm{t}_{\mathrm{r}}, \mathrm{t}_{\mathrm{f}}$ | Output Rise/Fall Time 20\% to 80\% | At full swing. |  | 35 | 75 | 110 | ps |

## Notes:

7. Skew is measured between outputs of the same bank under identical transitions.
8. Skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
9. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, $T_{n}-T_{n-1}$ where $T$ is the time between rising edges of the output signal.
10. Total jitter definition: with an ideal clock input of frequency $\leq \mathrm{f}_{\mathrm{MAX}}$, no more than one output edge in $10^{12}$ output edges will deviate by more than the specified peak-to-peak jitter value.
11. Random jitter is measured with a K 28.7 comma detect character pattern, measured at $2.5 \mathrm{Gbps} / 3.2 \mathrm{Gbps}$.
12. Deterministic jitter is measured at $2.5 \mathrm{Gbps} / 3.2 \mathrm{Gbps}$ with both K 28.5 and $2^{23}-1$ PRBS pattern

## LVPECL OUTPUT

LVPECL output have very low output impedance (open emitter), and small signal swing which results in low EMI. LVPECL is ideal for driving $50 \Omega$ and $100 \Omega$ controlled

Figure 4. Parallel Termination-Thevenin Equivalent
impedance transmission lines. There are several techniques in terminating the LVPECL output, as shown in Figures 4 through 6.

Figure 5. Parallel Termination (3-Resistor)

Note 1. Unused output (/Q) must be terminated to balance the output.
Note 2. For +2.5 V systems: $\mathrm{R} 1=250, \mathrm{R} 2=62.5, \mathrm{R} 3=1.25 \mathrm{k}, \mathrm{R} 4=1.2 \mathrm{k}$ For +3.3 V systems: $\mathrm{R} 1=130, \mathrm{R} 2=82 \quad, \mathrm{R} 3=1 \mathrm{k}, \mathrm{R} 4=1.6 \mathrm{k}$
Note 3. Unused output pairs ( $Q$ and $/ Q$ ) may be left floating.
