

**ULTRA-PRECISION CML  
AnyGate® WITH INTERNAL INPUT  
AND OUTPUT TERMINATION**

**Precision Edge®  
SY58051U**

**FEATURES**

- Three matched-delay input pair provide any logic function: AND, NAND, OR, NOR, XOR
- Guaranteed AC performance over temperature and voltage:
  - DC-to > 10.7Gbps data rate throughput
  - DC-to > 7GHz clock  $f_{MAX}$
  - < 190ps Any In-to-Out  $t_{pd}$
  - $t_r / t_f < 60ps$
- Ultra low-jitter design:
  - < 1ps<sub>RMS</sub> random jitter
  - < 10ps<sub>PP</sub> deterministic jitter
  - < 10ps<sub>PP</sub> total jitter (clock)
- Unique input termination and  $V_T$  pin accepts DC-coupled and AC-coupled inputs (CML, PECL)
- Internal 50Ω output source termination
- Typical 400mV CML output swing ( $R_{IN} = 50\Omega$ )
- Internal 50Ω input termination
- Power supply 2.5V ±5% or 3.3V ±10%
- -40°C to 85°C temperature range
- Available in a 16-pin (3mm × 3mm) MLF® package

**APPLICATIONS**

- Data communication systems
- OC-192, OC-192+FEC
- All SONET OC-3 — OC-768 applications
- All Fibre Channel applications
- All GigE applications

Precision Edge®

**DESCRIPTION**

The SY58051U is an ultra-fast, low jitter universal logic gate with a guaranteed maximum data or clock throughput of 10.7Gbps or 7GHz, respectively. This AnyGate® differential logic device will produce many logic functions of two Boolean variables, such as AND, NAND, OR, NOR, DELAY, or NEGATION.

The SY58051U differential inputs include a unique, internal termination design that allows access to the termination network through a  $V_T$  pin. This feature allows the device to easily interface to different logic standards, both AC- and DC-coupled without external resistor-bias and termination networks. The result is a clean, stub-free, low-jitter interface solution. The differential CML output is optimized for 50Ω environments with internal 50Ω source termination and a 400mV output swing.

The SY58051U operates from a 2.5V or 3.3V supply, and is guaranteed over the full industrial temperature range (-40°C to +85°C). The SY58051U is part of a Micrel's Precision Edge® product family.

All support documentation can be found on Micrel's web site at [www.micrel.com](http://www.micrel.com).

2. Tape and Reel.
3. Pb-Free package recommended for new designs.

**PIN DESCRIPTION**

Pin Number	Pin Name	Pin Function
1	VTA	Input Termination Center Tap: Each of the two inputs, (A, /A) terminates to this pin through a 50Ω resistor. The V <sub>TA</sub> pin provides a center-tap to a termination network for maximum interface flexibility. See “Input Interface Applications” section for more details.
15,16 2, 3	A, /A B, /B	Differential Input: These input pairs are the two data inputs to the device. Each pin of a pair internally terminates to the V <sub>TA</sub> or V <sub>TB</sub> pin to 50Ω. Note that these inputs will default to an indeterminate state if left open. See “Input Interface Applications” section for more details.
4	VTB	Input Termination Center Tap: Each of the two inputs, (B, /B) terminates to this pin through a 50Ω resistor. The V <sub>TB</sub> pin provides a center-tap to a termination network for maximum interface flexibility.
5, 6	S, /S	Differential Input: This input pair is the select input to the device. Each pin of this pair internally terminates to the V <sub>TS</sub> pin to 50Ω. Note that this input will default to an indeterminate state if left open. See “Input Interface Applications” section for more details.
7	VTS	Input Termination Center Tap: Each of the two inputs, S, /S terminates to this pin. The V <sub>TS</sub> pin provides a center-tap to a termination network for maximum interface flexibility.
8, 13	VCC	Positive Power Supply. Bypass with 0.1μF    0.01μF low ESR capacitors.
12, 9	Q, /Q	Differential Output: This CML output pair is the output of the device. It is a logic function of the A, B, and S inputs. See “Truth Tables” for details.
10, 11, 14	GND, (Exposed Pad)	Ground. Exposed pad must be connected to the same potential as GND pin.

**Notes:**

1. Permanent device damage may occur if the ratings in the "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied for conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Due to the limited drive capability use for input of the same package only.
4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.  $\psi_{JB}$  uses 4-layer  $\theta_{JA}$  in still-air, unless otherwise stated.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. Due to the internal termination (see Figure 1a) the input current depends on the applied voltages at A, /A and  $V_{TA}$  inputs, the B, /B and  $V_{TB}$  inputs or the S, /S and  $V_{TS}$  inputs. Do not apply a combination of voltages that causes the input current to exceed the maximum limit!

**Notes:**

- The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
- Measured with 100mV input swing. See "Timing Diagrams" section for definition of parameters. High-frequency AC parameters are guaranteed by design and characterization.
- Skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
- Random jitter is measured with a K28.7 comma detect character pattern, measured at 2.5Gbps/3.2Gbps.
- Deterministic jitter is measured at 2.5Gbps/3.2Gbps with both K28.5 and 2<sup>23</sup>-1 PRBS pattern.
- Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, T<sub>n</sub>-T<sub>n-1</sub> where T is the time between rising edges of the output signal.
- Total jitter definition: with an ideal clock input of frequency ≤ f<sub>MAX</sub>, no more than one output edge in 10<sup>12</sup> output edges will deviate by more than the specified peak-to-peak jitter value.
