# LMV111 **Operational Amplifier with Bias Network**

#### **General Description**

The LMV111 integrates a rail-to-rail op amp with a V<sup>+</sup>/2 bias circuit into one ultra tiny package, SC70-5 or SOT23-5. The core op amp of the LMV111 is an LMV321, which provides rail-to-rail output swing, excellent speed-power ratio, 1MHz bandwidth, and 1V/µs of slew rate with low supply current.

The LMV111 reduces external component count. It is a cost effective solution for applications where low voltage operation, low power consumption, space saving, and reliable performance are needed. It enables the design of small portable electronic devices, and allows the designer to place the device closer to the signal source to reduce noise pickup and increase signal integrity.

#### Features

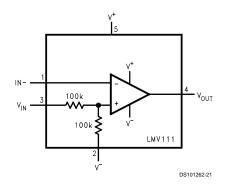

(For 5V Supply, Typical Unless Otherwise Noted)

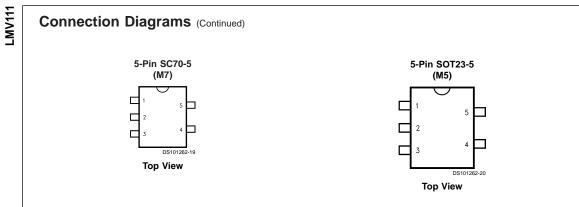

- Resistor ratio matching 1% (typ)
- SC70-5 & SOT23-5 Space saving package
- -40°C to +85°C Industrial temp. range 130µA Low supply current
- Gain-bandwidth product
- 1MHz Rail-to-Rail output swing
- Guaranteed 2.7V and 5V performance

#### Applications

- General purpose portable devices
- Active filters
- Mobile communications
- Battery powered electronics
- Microphone preamplifiers

## **Connection Diagrams**

# **Ordering Information**

Package	Package Part Number Marking		Transport Media	NSC Drawing	
SC70-5	LMV111M7	A42	1k Units Tape and Reel	MAA05A	
	LMV111M7X	A42	3k Units Tape and Reel		
SOT23-5	LMV111M5	A37A	1k Units Tape and Reel	MA05B	
	LMV111M5X		3k Units Tape and Reel	IVIAUSD

**Operating Ratings** (Note 1)

### 2.7V Electrical Characteristics

Unless otherwise specified, all limits guaranteed for T  $_{\rm J}$  = 25°C, V<sup>+</sup> = 2.7V, V<sup>-</sup> = 0V, V<sub>O</sub> = V<sup>+</sup>/2 and R<sub>L</sub> > 1 M $\Omega$ . Boldface limits apply at the temperature extremes.

Symbol	Parameter	Conditions	Typ (Note 6)	Limit (Note 7)	Units
V <sub>O</sub> Out	Output Swing	$R_L = 10k\Omega$ to 1.35V	V+ -0.01	V+ -0.1	V
					min
			0.06	0.18	V
					max
I <sub>S</sub> Sur	Supply Current		80	170	μA
					max
	Resistor Ratio Matching		1		%
GBWP	Gain-Bandwidth Product	C <sub>L</sub> = 200pF	1		MHz
$\Phi_{m}$	Phase Margin		60		Deg
G <sub>m</sub>	Gain Margin		10		dB

### **5V Electrical Characteristics**

Unless otherwise specified, all limits guaranteed for T  $_{\rm J}$  = 25°C, V<sup>+</sup> = 5V, V<sup>-</sup> = 0V, V<sub>O</sub> = V<sup>+</sup>/2 and R<sub>L</sub> > 1 MΩ. Boldface limits apply at the temperature extremes.

Symbol	Parameter	Conditions	Typ (Note 6)	Limit (Note 7)	Units
Vo	Output Swing	$R_L = 2k\Omega$ to 2.5V	V+ -0.04	V+ -0.3	V
				V+ -0.4	min
			0.12	0.3	V
				0.4	max
		$R_L = 10k\Omega$ to 2.5V	V+ -0.01	V+ -0.1	V
				V+ –0.2	min
			0.065	0.18	V
				0.28	max
lo	Output Current	Sourcing, V <sub>O</sub> = OV	60	5	mA
					min
		Sinking, $V_0 = 5V$	160	10	mA
					min
I <sub>S</sub>	Supply Current		130	250	μA
				350	max
	Resistor Ratio Matching		1		%
GBWP	Gain-Bandwidth Product	C <sub>L</sub> = 200pF	1		MHz
φm	Phase Margin		60		Deg
G <sub>m</sub>	Gain Margin		10		dB
SR	Slew Rate	(Note 8)	1		V/µs

Note 2: Human body model,  $1.5k\Omega$  in series with 100pF. Machine model,  $0\Omega$  in series with 100pF.

# LMV111

#### 5V Electrical Characteristics (Continued)

Note 3: Shorting circuit output to V<sup>+</sup> will adversely affect reliability.

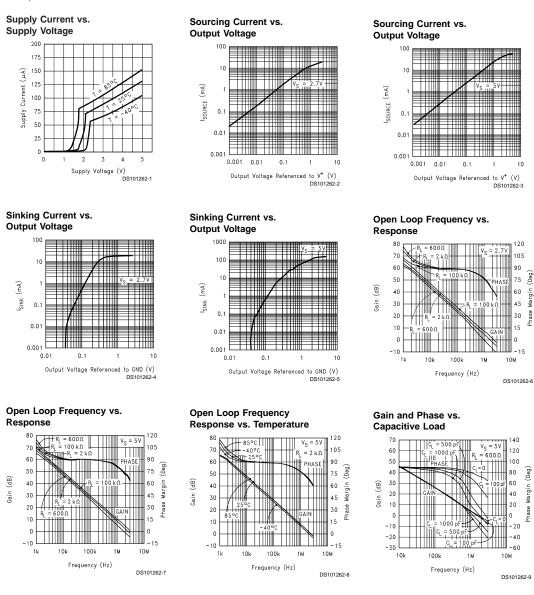

Note 4: Shorting circuit output to V - will adversely affect reliability.

Note 5: The maximum power dissipation is a function of  $T_{J(max)}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is P  $_D = (T_{J(max)} - T_A)/\theta_{JA}$ . All numbers apply for packages soldered directly into a PC board.

- Note 6: Typical values represent the most likely parametric norm.
- Note 7: All limits are guaranteed by testing or statistical analysis.

Note 8: Connected as voltage follower with 3V step input. Number specified is the slower of the positive and negative slew rates.

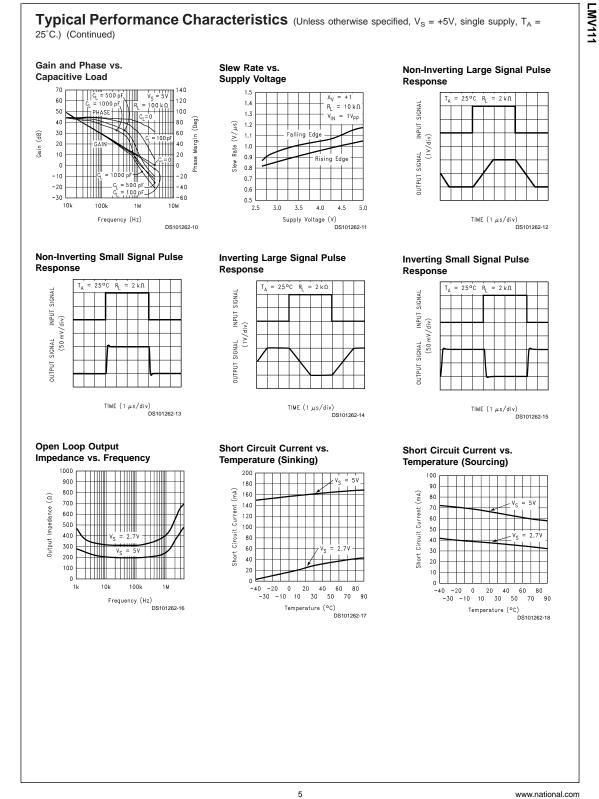

Typical Performance Characteristics (Unless otherwise specified, V<sub>s</sub> = +5V, single supply, T<sub>A</sub> = 25°C.)

#### Output Voltage Swing vs. Supply Voltage

#### **Application Section**

The LMV111 integrates a rail-to-rail op amp and a V <sup>+</sup>/2 bias circuit into one ultra tiny package. With its small footprint and reduced component count for bias network, it enables the design of smaller portable electronic products, such as cellular phones, pagers, PDAs, PCMCIA cards, etc. In addition, the integration solution minimizes printed circuit board stray capacitance, and reduces the complexity of circuit design. The core op amp of this family is National's LMV321.

#### 1.0 Supply Bypassing

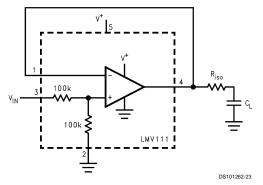

The application circuits in this datasheet do not show the power supply connections and the associated bypass capacitors for simplification. When the circuits are built, it is always required to have bypass capacitors. Ceramic disc capacitors (0.1 $\mu$ F) or solid tantalum (1 $\mu$ F) with short leads, and located close to the IC are usually necessary to prevent interstage coupling through the power supply internal impedance. Inadequate bypassing will manifest itself by a low frequency oscillation or by high frequency instabilities. Sometimes, a 10 $\mu$ F (or larger) capacitor is used to absorb low frequency variations and a smaller 0.1 $\mu$ F disc is paralleled across it to prevent any high frequency feedback through the power supply lines.

#### 2.0 Input Voltage Range

The input voltage should be within the supply rails. The ESD protection circuitry at the input of the device includes a diode between the input pin and the negative supply pin. Driving the input more than 0.6V (at 25°C) beyond the negative supply will turn on the diode and cause signal distortions.

#### 3.0 Capacitive Load Tolerance

The LMV111 can directly drive 200pF capacitive load with unity gain without oscillation. The unity-gain follower is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers. The combination of the amplifier's output impedance and the capacitive load induces phase lag. This results in either an underdamped pulse or oscillation. To drive a heavier capacitive load, a resistive isolation can be used as shown in *Figure 1*.

# FIGURE 1. Resistive Isolation of a Heavy Capacitive Load

The isolation resistor  $R_{iso}$  and the  $C_L$  form a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of  $R_{iso}$ . A  $50\Omega$  to  $100\Omega$  isolation resistor is recommended for initial evaluation. The bigger the  $R_{iso}$  resistor value, the more stable  $V_{OUT}$  will be.

#### Application Section (Continued)

#### 4.0 Phase Inverting AC Amplifier

A single supply phase inverting AC amplifier is shown in *Figure 2*. The output voltage is biased at mid-supply, and AC input signal is amplified by (R<sub>2</sub>/R<sub>1</sub>). Capacitor C<sub>IN</sub> acts as an input AC coupling capacitor to block DC potentials. A capacitor of of 0.1 µF or larger can be used. The output of the LMV111 can swing rail-to-rail. To avoid output distortion, the peak-to-peak amplitude of the input AC signal should be less than V<sub>CC</sub>(R<sub>1</sub>/R<sub>2</sub>).

It is recommended that a small-valued capacitor is used across the feedback resistor  $R_2$  to eliminate stability problems, prevent peaking of the response, and limit the bandwidth of the circuit. This can also help to reduce high frequency noise and some other interference.

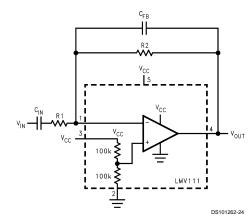

FIGURE 2. Phase Inverting AC Amplifier

#### 5.0 Fixed Current Source

A multiple fixed current source is show in *Figure 3*. A reference voltage ( $V_{REF} = 2.5V$ ) is established across resistor  $R_3$  by the voltage divider ( $R_3$  and  $R_4$ ). Negative feedback is used to cause the voltage drop across  $R_1$  to be equal to  $V_{REF}$ . This controls the emitter current of transistor Q1 and if we neglect the base current of Q1 and Q2, essentially this same current is available out of the collector of Q1. A Darlington connection can be used to reduce errors due to the bias current of Q1.

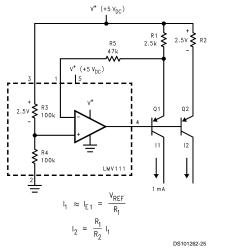

FIGURE 3. Fixed Current Source

#### 6.0 Difference Amplifier

The difference amplifier allows the subtraction of two voltages or, as a special case, the cancellation of a signal common to two inputs. It is useful as a computational amplifier, in making a differential to single-ended conversion or in rejecting a common mode signal.
