## 3.3 V 106.25 MHz/ 212.5 MHz PureEdge Clock Generator with LVPECL Differential Output

### Description

The NB3N3001 is a low-jitter, dual-rate PLL-synthesized clock generator. It accepts a standard 26.5625 MHz fundamental mode AT cut parallel resonant crystal as the reference source for its integrated crystal oscillator and low noise phase-locked loop (PLL) and produces user selectable clock frequencies of either 106.25 MHz or 212.5 MHz.

In addition, the PLL circuitry will generate a 50% duty cycle square-wave through a pair of differential LVPECL clock outputs. Typical phase jitter at 106.25 MHz is 0.3 ps RMS from 637 kHz to 10 MHz.

The LVPECL output drivers can be disabled to high impedance with the OE pin set LOW. The NB3N3001 operates from a single +3.3 V supply, and is available in both plastic package and die form. The operating temperature range is from -40°C to +85°C.

The NB3N3001 device provides the optimum combination of low cost, flexibility, and high performance which makes it ideal for Fibre-Channel applications.

### Features

- PureEdge Clock Family Provides Accuracy and Precision
- Selectable Output Frequency of 106.25 MHz or 212.5 MHz
- Crystal Oscillator Interface Designed for a 26.5625 MHz Crystal
- Fully Integrated Phase-Lock-Loop with Internal Loop Filter
- Differential 3.3 V LVPECL Outputs
- Exceeds Bellcore and ITU Jitter Generation Specification
- RMS Phase Jitter @ 106.25 MHz, using a 26.5625 MHz Crystal (637 kHz – 10 MHz): 0.3 ps (Typical)
- RMS Phase Noise at 106.25 MHz

#### Phase Noise:

Offset	Noise Power
100 Hz	-108 dBc/Hz
1 kHz	-122 dBc/Hz
10 kHz	-135 dBc/Hz
100 kHz	-135 dBc/Hz

- Operating Range:  $V_{CC} = 3.135 \text{ V to } 3.465 \text{ V}$
- -40°C to +85°C Ambient Operating Temperature
- Small Footprint 8-pin TSSOP Package
- This is a Pb-Free Device

Table 1. Output Frequency Select

FSEL	Output Frequency (MHz)
0	106.25
1	212.5

NOTE: Input crystal = 26.5625 MHz

Table 2. PIN DESCRIPTION

Pin	Symbol	Type	Description
1	V <sub>CCA</sub>	Power	Positive analog power supply pin. Connected to V <sub>CC</sub> with filter components (See Figure 8).
2	V <sub>EE</sub>	Power	Negative supply pin.
3	X <sub>OUT</sub>	Input	Crystal input (OUT).
4	X <sub>IN</sub>	Input	Crystal input (IN).
5	FSEL	LVTTL/LVCMOS Input	Frequency select pin. Defaults LOW when left open. Internal pull down resistor to V <sub>EE</sub> .
6	Q̄	Output	Inverted differential output. Typically terminated with 50 Ω to V <sub>CC</sub> -2.0 V.
7	Q	Output	Noninverted differential output. Typically terminated with 50 Ω to V <sub>CC</sub> -2.0 V.
8	V <sub>CC</sub>	Power	Positive digital core power supply pin. Connected to 3.3 V.

Table 3. ATTRIBUTES

Characteristic	Value
ESD Protection	Human Body Model Machine Model
Moisture Sensitivity (Note 1)	Pb-Free Pkg, TSSOP-8
Flammability Rating Oxygen Index: 28 to 34	UL 94 V-0 @ 0.125 in
Transistor Count	4150
Meets or exceeds JEDEC Spec EIA/JESD78 IC Latchup Test

APPLICATION INFORMATION

Power Supply Filtering

The NB3N3001 is a mixed analog/digital product, and as such, it exhibits some sensitivities that would not necessarily be seen on a fully digital product. Analog circuitry is naturally susceptible to random noise, especially if this noise is seen on the power supply pins. The NB3N3001 also generates sub-nanosecond output edge rates, and therefore, a good power supply bypassing scheme is a must.

The NB3N3001 provides separate power supplies for the digital circuitry ( $V_{CC}$ ) and the internal PLL ( $V_{CCA}$ ). The simplest form of noise isolation is a power supply filter on the  $V_{CCA}$  pin.

Figure 8 illustrates a typical power supply filter scheme. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the bandwidth of the PLL.

The purpose of this design technique is to try and isolate the high switching noise of the digital outputs from the relatively sensitive internal analog phase-locked loop. The power supply filter and bypass schemes discussed in this section should be adequate to eliminate power supply noise-related problems in most designs.

Crystal Oscillator Input Interface

The NB3N3001 features an integrated crystal oscillator to minimize system implementation costs. The oscillator circuit is a parallel resonant circuit and thus, for optimum performance, a parallel resonant crystal should be used.

As the oscillator is somewhat sensitive to loading on its inputs, the user is advised to mount the crystal as close to the NB3N3001 as possible to avoid any board level parasitics. Surface mount crystals are recommended, but not required.

Figure 9 illustrates a parallel resonant crystal with its associated load capacitors. The capacitor values shown were determined using a 26.5625 MHz, 18 pF parallel resonant crystal and were chosen to minimize the ppm error. Capacitor values can be adjusted slightly for different board layouts to optimize accuracy.

Figure 8. Power Supply Filtering

Figure 9. Crystal Input Interface

APPLICATION SCHEMATIC

Figure 10 shows a schematic example of the NB3N3001. An example of LVPECL termination is shown in this schematic. Additional LVPECL termination approaches are shown in the AND8020 Application Note. In this example, an 18 pF parallel resonant 26.5625MHz crystal is used for

generating 106.25 MHz output frequency. The  $C1 = 27$  pF and  $C2 = 33$  pF are recommended for frequency accuracy. For different board layout, the  $C1$  and  $C2$  values may be slightly adjusted for optimizing frequency accuracy.

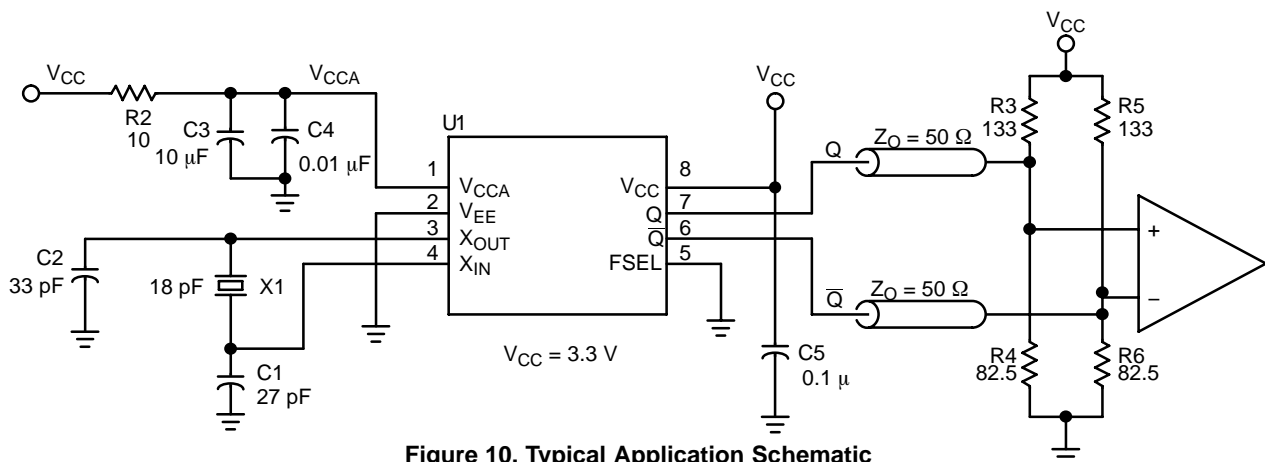

Figure 10. Typical Application Schematic

**PC Board Layout Example**

Figure 11 shows a representative board layout for the NB3N3001. There exists many different potential board layouts and the one pictured is but one. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed in Table 11. There should be at least one decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane. The important aspect of the layout in Figure 11 is the low impedance connections between VCC and GND for the bypass capacitors. Combining good quality general purpose chip capacitors with good PCB layout techniques will produce effective capacitor resonances at frequencies adequate to supply the instantaneous switching current for the NB3N3001 outputs. It is imperative that low inductance chip capacitors are used. It is equally important that the board layout not introduce any of the inductance saved by using the leadless capacitors. Thin interconnect traces between the capacitor and the power plane should be avoided and multiple large vias should be used to tie the capacitors to the buried power planes. Fat interconnect and large vias will help to minimize layout induced inductance and thus maximize the series resonant point of the bypass capacitors.

The voltage amplitude across the crystal is relatively small. It is imperative that no actively switching signals cross under the crystal as crosstalk energy coupled to these lines could significantly impact the jitter of the device.
