

General Description

The MAX9374 and MAX9374A are 2.0GHz differential LVPECL-to-LVDS translators and are designed for telecom applications. They feature 250ps propagation delay. The differential output conforms to the ANSI TIA/EIA-644 LVDS standard. The inputs are biased with internal resistors such that the output is differential low when inputs are open. An on-chip VBB reference output is available for single-ended operation.

The MAX9374 is designed for low-voltage operation from a 2.375V to 2.625V power supply for use in 2.5V systems. The MAX9374A is designed for 3.0V to 3.6V operation in systems with a nominal 3.3V supply. Both devices are offered in industry-standard 8-pin SOT23 and SO packages.

Applications

Precision Clock Buffer Low-Jitter Data Repeater Central Office Clock Distribution DSLAM/DLC

Base Station

Mass Storage

Features

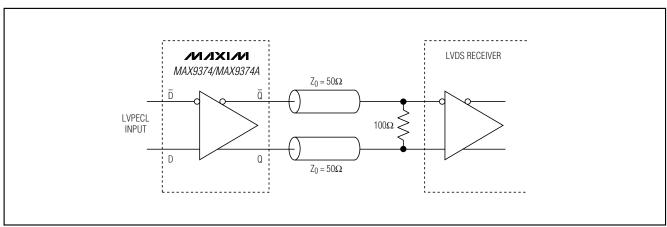

- ♦ Guaranteed 2.0GHz Operating Frequency
- **♦** 250ps (typ) Propagation Delay
- ♦ 1.0ps RMS Jitter (typ)
- ♦ 2.375V to 2.625V Low-Voltage Supply Range (MAX9374)
- ♦ On-Chip VBB Reference for Single-Ended Input
- **♦ Output Low for Open Inputs**
- ♦ Output Conforms to ANSI TIA/EIA-644 LVDS **Standard**
- ♦ ESD Protection >2.0kV (Human Body Model)
- ♦ Available in Small 8-Pin SOT23 Package

Pin Description

PI	N	NAME	FUNCTION
SOT23	so	INAIVIE	FUNCTION
1	4	V _{BB}	Reference Output Voltage. Connect to the inverting or noninverting data input to provide a reference for single-ended operation. When used, bypass with a 0.01µF ceramic capacitor to V _{CC} ; otherwise, leave it open.
2	5	GND	Ground. Provide a low-impedance connection to the ground plane.
3	3	D	Inverted LVPECL Data Input. 36.5k Ω pullup to V _{CC} and 75k Ω pulldown to GND.
4	2	D	Noninverted LVPECL Data Input. 75k Ω pullup to V _{CC} and 75k Ω pulldown to GND.
5	8	Vcc	Positive Supply Voltage. Bypass V _{CC} to GND with 0.1µF and 0.01µF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
6	7	Q	Noninverted LVDS Output. Typically terminate with 100Ω to $\overline{\mathbb{Q}}$.
7	6	Q	Inverted LVDS Output. Typically terminate with 100Ω to Q.
8	1	N.C.	No Connection. Not internally connected.

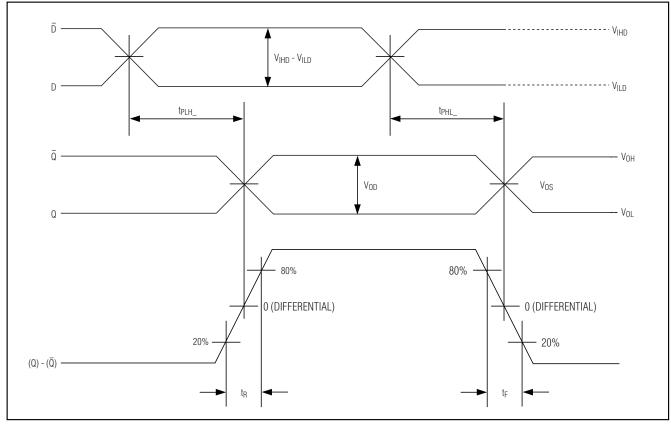

Figure 1. MAX9374/MAX9374A Timing Diagram

///XI/M ______ 5

Detailed Description

The MAX9374/MAX9374A are 2.0GHz differential LVPECL-to-LVDS translators. The output is differential LVDS and conforms to the ANSI TIA/EIA-644 LVDS standard. The inputs are biased with internal resistors such that the output is differential low when inputs are open. An on-chip VBB reference output is available for single-ended input operation. The MAX9374 is designed for low-voltage operation from 2.375V to 2.625V in systems with a nominal 2.5V supply. The MAX9374A is designed for 3.0V to 3.6V operation in systems with a nominal 3.3V supply.

Differential LVPECL Input

The MAX9374/MAX9374A accept differential LVPECL inputs and can be configured to accept single-ended inputs through the use of the V_{BB} voltage reference output. The maximum magnitude of the differential signal applied to the input is 3.0V or V_{CC} , whichever is less. This limit also applies to the difference between any reference voltage input and a single-ended input. Specifications for the high and low voltages of a differential input (V_{IHD} and V_{ILD}) and the differential input voltage (V_{IHD} - V_{ILD}) apply simultaneously.

Single-Ended Inputs and VBB

The differential inputs can be configured to accept a single-ended input through the use of the VBB reference voltage. A noninverting, single-ended input is produced by connecting VBB to the \overline{D} input and applying a single-ended input signal to the D input. Similarly, an inverting input is produced by connecting VBB to the D input and applying the input signal to the \overline{D} input. With a differential input configured as single ended (using VBB), the single-ended input can be driven to VCC and GND or with a single-ended LVPECL signal. Note that a single-ended input must be at least VBB $\pm 95 \mathrm{mV}$ or a differential input of at least 95 mV to switch the outputs to the VOH and VOL levels specified in the DC Electrical Characteristics table.

When using the VBB reference output, bypass it with a $0.01\mu F$ ceramic capacitor to VCC. If the VBB reference is not used, leave it unconnected. Use VBB only for inputs that are on the same device as the VBB reference.

Input Bias Resistors

Internal biasing resistors ensure a (differential) output-low condition in the event that the inputs are not connected. The inverting input (\overline{D}) is biased with a 36.5k Ω pull-down to VCC and a 75k Ω pullup to GND. The noninverting input (D) is biased with a 75k Ω pullup to VCC and 75k Ω pulldown to GND.

Differential LVDS Output

The differential outputs conform to the ANSI TIA/EIA-644 LVDS standard. Typically, terminate the outputs with 100Ω across Q and $\overline{\rm Q}$, as shown in the *Typical Application Circuit*. The outputs are short-circuit protected.

Applications Information

Supply Bypassing

Bypass VCC to GND with high-frequency surface-mount ceramic $0.1\mu F$ and $0.01\mu F$ capacitors in parallel and as close to the device as possible, with the $0.01\mu F$ capacitor closest to the device. Use multiple parallel vias to minimize parasitic inductance. When using the VBB reference output, bypass it with a $0.01\mu F$ ceramic capacitor to VCC (if the VBB reference is not used, it can be left open).

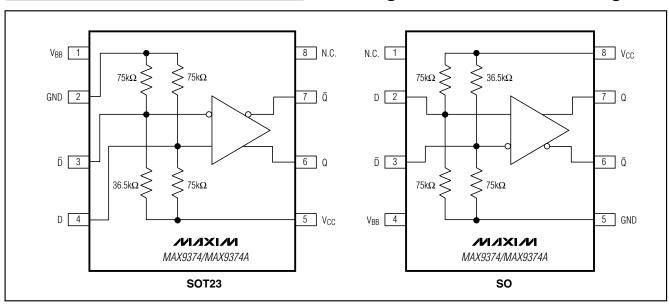

Controlled-Impedance Traces

Input and output trace characteristics affect the performance of the MAX9374/MAX9374A. Connect high-frequency input and output signals to 50Ω characteristic impedance traces. Minimize the number of vias to prevent impedance discontinuities. Reduce reflections by maintaining the 50Ω characteristic impedance through cables and connectors. Reduce skew within a differential pair by matching the electrical length of the traces.

Output Termination

Terminate the outputs with 100Ω across Q and \overline{Q} as shown in the *Typical Application Circuit*. Both outputs must be terminated.
