SEMICONDUCTOR TM

# MM74HC259 8-Bit Addressable Latch/3-to-8 Line Decoder

#### **General Description**

The MM74HC259 device utilizes advanced silicon-gate CMOS technology to implement an 8-bit addressable latch, designed for general purpose storage applications in digital systems.

The MM74HC259 has a single data input (D), 8 latch outputs (Q1–Q8), 3 address inputs (A, B, and C), a common enable input ( $\overline{G}$ ), and a common CLEAR input. To operate this device as an addressable latch, data is held on the D input, and the address of the latch into which the data is to be entered is held on the A, B, and C inputs. When ENABLE is taken LOW the data flows through to the addressed output. The data is stored when ENABLE transitions from LOW-to-HIGH. All unaddressed latches will remain unaffected. With enable in the HIGH state the device is deselected, and all latches remain their previous state, unaffected by changes on the data or address

inputs. To eliminate the possibility of entering erroneous data into the latches, the enable should be held HIGH (inactive) while the address lines are changing.

If enable is held HIGH and CLEAR is taken LOW all eight latches are cleared to a LOW state. If enable is LOW all latches except the addressed latch will be cleared. The addressed latch will instead follow the D input, effectively implementing a 3-to-8 line decoder.

All inputs are protected from damage due to static discharge by diodes to  $\rm V_{CC}$  and ground.

#### **Features**

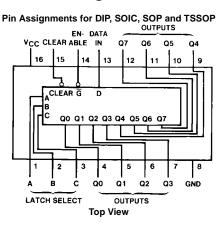

- Typical propagation delay: 18 ns
- Wide supply range: 2–6V
- Low input current: 1 μA maximum
- Low quiescent current: 80 µA maximum (74HC Series)

#### **Ordering Code:**

Order Number	Package Number	Package Description
MM74HC259M	M16A	16-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-120, 0.150" Narrow
MM74HC259SJ	M16D	16-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide
MM74HC259MTC	MTC16	16-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide
MM74HC259N	N16E	16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

		$ I_{OUT}  \le 5.2 \text{ mA}$	6.0V	0.2	0.26	0.33	0.4	V
I <sub>IN</sub>	Maximum Input	$V_{IN} = V_{CC}$ or GND	6.0V		±0.1	±1.0	±1.0	μA
	Current							
I <sub>CC</sub>	Maximum Quiescent	$V_{IN} = V_{CC}$ or GND	6.0V		8.0	80	160	μΑ
	Supply Current	$I_{OUT} = 0 \ \mu A$						

Note 4: For a power supply of 5V  $\pm$ 10% the worst case output voltages (V<sub>OH</sub>, and V<sub>OL</sub>) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V<sub>IH</sub> and V<sub>IL</sub> occur at V<sub>CC</sub>=5.5V and 4.5V respectively. (The V<sub>IH</sub> value at 5.5V is 3.85V.) The worst case leakage current (I<sub>IN</sub>, I<sub>CC</sub>, and I<sub>OZ</sub>) occur for CMOS at the higher voltage and so the 6.0V values should be used.

Note 5:  $C_{PD}$  determines the no load dynamic power consumption,  $P_D = C_{PD} V_{CC}^2 f + I_{CC} V_{CC}$ , and the no load dynamic current consumption,  $I_S = C_{PD} S V_{CC} s f + I_{CC}$ .
