

DATA SHEET

SKY73101-11: 1930–1990 MHz High Performance VCO/Synthesizer With Integrated Switch

Applications

- 2G, 2.5G, and 3G base station transceivers:
 - GSM, EDGE, CDMA, WCDMA
- General purpose RF systems

Features

- Frequency operation range: 1930 to 1990 MHz
- Process-tolerant compensation for VCO
- 24-bit $\Sigma\Delta$ fractional-N synthesizer
- Ultra-fine frequency resolution of 0.001 ppm
- Flexible reference frequency selection
- Three-wire serial interface up to 20 MHz clock frequency
- Integrated PLL supply regulation for spur isolation
- MCM (38-pin, 9 x 12 mm) SMT package (MSL3, 260 °C per JEDEC J-STD-020)

NEW

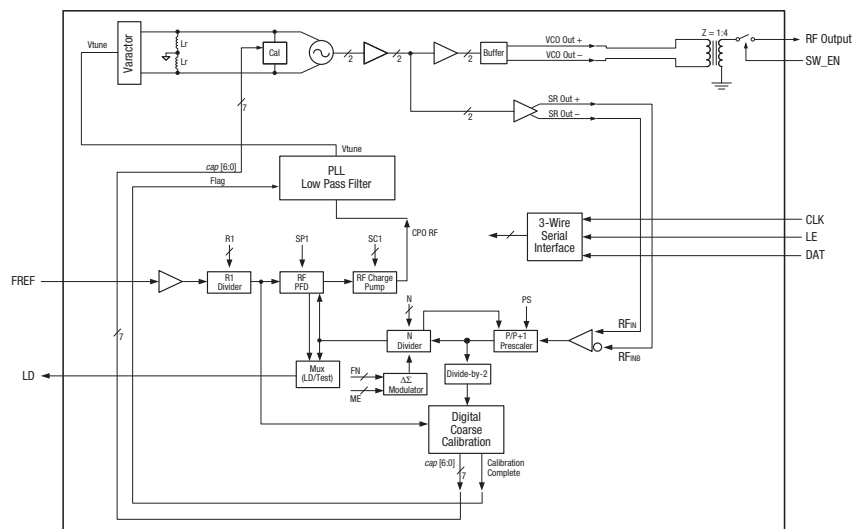

Skyworks Green™ products are RoHS (Restriction of Hazardous Substances)-compliant, conform to the EIA/EICTA/JEITA Joint Industry Guide (JIG) Level A guidelines, are halogen free according to IEC-61249-2-21, and contain <1,000 ppm antimony trioxide in polymeric materials.

Description

Skyworks SKY73101-11 Voltage-Controlled Oscillator (VCO)/Synthesizer is a fully integrated, high performance signal source for high dynamic range transceivers. The device provides ultra-fine frequency resolution, fast switching speed, and low phase noise performance for 2G, 2.5G, and 3G base station transceivers.

The SKY73101-11 VCO/Synthesizer is a key building block for high-performance radio system designs that require low power and a fine step size. Reference clock generators with an output frequency up to 52 MHz can be used with the SKY73101-11. A functional block diagram is shown in Figure 1. As indicated in this diagram, the reference frequency is divided down by 1, 2, 4, or 8 in the R1 divider, depending on the value of the reference divisor input (R1). Refer to the Reference Input Divider section (page 10) for more information.

The SKY73101-11 VCO/Synthesizer is provided in a compact, 38-pin Multi-Chip Module (MCM). The device package and pinout are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

Technical Description

The SKY73101-11 is a fractional-N frequency synthesizer using a $\Sigma\Delta$ modulation technique. The fractional-N implementation provides low in-band noise by having a low division and fast frequency settling time. The device also provides programmable, arbitrary fine frequency resolution. This compensates the frequency synthesizer for crystal frequency drift.

Serial I/O Control Interface

The SKY73101-11 is programmed through a three-wire serial bus control interface using four 26-bit words. The three-wire interface consists of three signals: CLK (pin 17), LE (pin 19), and the bit serial data line DATA (pin 18). The convention is to load data from the most significant bit to the least significant bit (MSB to LSB). A serial data input timing diagram is shown in Figure 3. Preset timing parameter values are provided in Table 2.

Although the SKY73101-11 uses a 5 V DC supply, the internal voltage regulator has a 3.3 V output for the PLL. Therefore, the input DC voltage for the serial interface (CLK, DATA, and LE signals) should be set to 3.3 V or lower.

Figure 4 depicts the serial bus, which consists of one 26-bit load register and four separate 24-bit registers. Data is initially clocked into the load register starting with the MSB and ending with the LSB. The LE signal is used to gate the clock to the load register, requiring the LE signal to be brought low before the data load. Data is shifted on the rising edge of CLK.

The two final LSBs are decoded to determine which holding register should latch the data. The falling edge of LE latches the data into the appropriate holding register. This programming sequence must be repeated to fill all four holding registers.

The specific hold register addresses are determined by the wd_0 and wd_1 parameters in the load register. These are the two LSBs (bits [1:0]) as shown in Figure 4. Table 3 lists the four hold registers and their respective addresses as determined in the load register.

The contents of each word in the load register are used to program the four hold registers described in Tables 4 through 7.

The dpll_ctrl parameter (bits [19:2] of Word 1) programs the Digital Phase Locked Loop (DPLL) block. Each of the 18 bits that comprise the dpll_ctrl parameter map directly to the signal ports on the DPLL block as shown in Table 8 (except for the dpll_flag_override and dpll_flag_value parameters).

Loading new data into a holding register not associated with the synthesizer frequency programming does not reset or change the synthesizer. The synthesizer should not lose lock before, during, or after a new serial word load that does not change the programmed frequency.

VCO Auto-Tuning Loop

A VCO auto-tuning loop provides the proper 7-bit coarse tuning setting for the VCO switch capacitors in the VCO output. This sets the oscillation frequency as close to target as possible before starting fine analog tuning.

When VCO auto-tuning is enabled, the PLL performs a seven-step successive approximation process to digitally tune the VCO close to the final programmed frequency. Once that is complete, analog tuning is switched in to lock the VCO to the programmed frequency.

The auto-tuning loop is designed to compensate process variation so that the VCO fine tuning range can be reduced to cover temperature variation only. It significantly reduces VCO gain (Kv) which reduces VCO phase noise.

There are two conditions that enable the VCO auto-tuning function: a Power-On-Reset (POR) and a change in frequency. The difference in the program flow under each of these conditions is illustrated in Figure 5. Under either condition, dpll_en (bit [20] of Word 1) should first be cleared so that a rising edge pulse can be generated. Following this pulse, set dpll_en to enable VCO auto-tuning.

A POR timing diagram is shown in Figure 6. VCO auto-tuning details in the frequency and time domains are shown in Figure 7.

S2150

Figure 7. VCO Auto-Tuning @ 1960 MHz Frequency Settling

VCO Prescalers

The VCO prescalers divide the VCO output signal by either 16/17 or 8/9. The $\Sigma\Delta$ modulator determines whether to divide by 16 or 17 in the 16/17 mode, or whether to divide by 8 or 9 in the 8/9 mode. The 8/9 mode provides the best performance for the SKY73101-11.

N-Counter

The N-counter consists of two asynchronous ripple counters, a 6-bit M-counter and a 4-bit A-counter. The M-counter determines the counts using the lower division ratio in the prescaler (8 or 16); the A-counter determines the counts using the upper division ratio (9 or 17).

The total N-counter divider ratio for the 8/9 mode is 56 (8×7) minimum; for the 16/17 mode, the ratio is 240 (16×15) minimum.

By changing the counter setting at each reference clock cycle, the Modulated Fractional Divider (MFD) achieves the desired noise shaping.

VCO MFD Block

The MFD block divides down the prescaler output to the Phase Locked Loop (PLL) reference frequency. A third order cascaded $\Sigma\Delta$ modulation technique minimizes spurs through randomization of the division ratio.

The MFD block controls the division ratio by dynamically programming the M and A counters in the N-counter.

Phase Detector and Charge Pump

The phase detector and charge pump detect and integrate the phase and frequency errors of the divided down VCO output versus the reference clock. This results in a feedback adjustment of the control voltage for the VCO.

Lock Detect

Lock detection circuitry provides a CMOS logic level indication when the PLL is frequency locked (high when locked). Normally, pin 22 (LD) is used for lock detect output. This pin can also be programmed as the R1 divider output, N-divider output, or DPLL test output. Pin 22 is controlled by Word 0, bits [17:15].

Reference Input Divider

The R-counter (reference input clock divider) consists of three divide-by-two blocks and one multiplexer controlled by the rdiv[3:2] parameter in Word 2. The R1 divider is used to select a divide-by-one, two, four, or divide-by-eight function.

The integral loop filter (see Figure 1) is designed to operate at an internal comparison frequency of approximately 6.5 MHz. The input reference signal must be divided using the rdiv [3:2] bits in Word 2 to closely match this frequency. Further optimization of the loop filter bandwidth may be accomplished using the cp_output [4:2] bits in Word 0.

Reference Buffer Bandwidth

The two-bit parameter *ref_bw_sel* adjusts the operating point of the input buffer to compensate for different reference signal sources. Generally the best setting is 50 MHz, but this could vary depending on the source used.

Synthesizer Output Switch

An on-chip switch is integrated into the SKY73101-11 RF output after the balun and is controlled by the SW_EN signal (pin 4) as indicated below:

SW_EN Input	Synthesizer Output
High	On
Low	Off

The switch provides >50 dB isolation at the synthesizer RF output. This allows the SKY73101-11 to be used for GSM applications.

Synthesizer Programming

To program the synthesizer to the correct frequency, values for the N-counter (both M and A portions), fractional divisor (FN), and fractional modulus extender (ME) are needed. These values are used to determine the total divider ratio, *D_{Total}*, according to Equation 1:

$$D_{Total} = N_{actual} + FN_{actual} + ME_{actual} + 3.5 \tag{1}$$

Where: *N_{actual}* = the actual value of the N-counter

FN_{actual} = the actual fractional divisor

ME_{actual} = the actual fractional modulus extender

Because of the way the ΔΣ modulator is implemented in the SKY73101-11, the number 3.5 must be added to the division number to obtain the final division ratio.

The calculated value for *D_{Total}* can then be used to determine the correct synthesizer frequency, *RF*:

$$RF = \frac{F_{REF}}{R1} \times D_{Total} \tag{2}$$

Where: *F_{REF}* = the reference frequency

R1 = the reference divider ratio

The 6-bit M-counter and the 4-bit A-counter portions of the N-counter are calculated according to the following relationships:

N_{actual} is the actual N-counter value and is the integer portion of (*D_{Total}* – 3.5):

$$N_{actual} = M_{actual} \times P + A_{actual} \tag{3}$$

If: *M* = *M_{actual}* (binary number, fit to six bits)

A = *A_{actual}* (binary number, fit to four bits)

Then: *N* = *M* × 2⁴ + *A*

Where: *N* is the number to be programmed into the N-counter.

The synthesizer has a selectable prescaler of 8/9 or 16/17. If the 16/17 prescaler is used:

$$P = 2^4 = 16$$

In this case, *N* is the same as *N_{actual}*, *M* is equal to the six MSBs of *N_{actual}*, and *A* is equal to the four LSBs of *N_{actual}*.

If the 8/9 prescaler is used:

$$P = 8$$

Here, *N* is not equal to *N_{actual}*. The A-counter portion only uses the three LSBs (the 4th bit of the A-counter is a “don’t care” bit).

NOTE: The minimum actual N counter value for the 8/9 mode is 8 x 7 = 56, and for the 16/17 mode is 16 x 15 = 240.

The fractional divisor code (FN) sets the fractional-N modulo up to 256 modulo according to the following equation:

$$FN_{actual} = D_7 \left(\frac{1}{2} \right) + D_6 \left(\frac{1}{2^2} \right) + D_5 \left(\frac{1}{2^3} \right) + \dots + D_0 \left(\frac{1}{2^8} \right) \tag{4}$$

The value of *FN* is equal to the binary representation of 256 (or 2⁸) × *FN_{actual}*, or:

$$FN = D_7 \times 2^7 + D_6 \times 2^6 + D_5 \times 2^5 + \dots + D_0$$

The fractional modulo can be extended up to 2²³ using the modulo extender (ME) if required:

$$ME_{actual} = D_{14}(1/2^9) + D_{13}(1/2^{10}) + D_{12}(1/2^{11}) + \dots + D_0(1/2^{23})$$

The value of ME is equal to the binary representation of the integer part of $2^{23} \times ME_{actual}$, or:

$$ME = D_{14} \times 2^{14} + D_{13} \times 2^{13} + D_{12} \times 2^{12} + \dots + D_0$$

Example :

A desired synthesizer frequency of 1960 MHz is required using a crystal frequency of 52 MHz and an 8/9 prescaler. Since the maximum internal reference frequency is 25 MHz, the crystal frequency needs to be divided; a reference divider ratio of 8 is used for this example.

Restating Equation (2) as a function of D_{Total} :

$$D_{Total} = (1960 \times 8) / 52 = 301.538461538461$$

Where: $RF = 1960$

$$R1 = 8$$

$$F_{REF} = 52$$

Determine N_{actual} by subtracting 3.5 from D_{Total} and removing the fractional portion:

$$D_{Total} - 3.5 = 298.038461538461$$

Using Equation (3):

$$N_{actual} = 298 = M_{actual} \times P + A_{actual}$$

where: $M_{actual} = 37$

$$P = 8$$

$$A_{actual} = 2$$

$$M = M_{actual} = 37 = 100101b \text{ (the six MSBs)}$$

$$A = A_{actual} = 2 = 0010b \text{ (the four LSBs)}$$

$$N = M \times 2^4 + A = 1001010010b \text{ (the value programmed)}$$

Multiply the fractional portion that was removed in the previous step by 256 and remove the fractional portion of the result to determine FN :

$$0.038461538461 \times 256 = 9.846153846016$$

$$FN = 9 = 00001001b \text{ (the value programmed)}$$

Divide FN by 256 to determine the actual fractional part, FN_{actual} :

$$FN_{actual} = 9 / 256 = 0.03515625$$

Subtract this result from the fractional portion of $D_{Total} - 3.5$ to determine the actual fractional modulus extender, ME_{actual} :

$$\begin{aligned} ME_{actual} &= (D_{Total} - 3.5 - N_{actual}) - FN_{actual} \\ &= 0.038461538461 - 0.03515625 \\ &= 0.038461538461 \end{aligned}$$

Multiply this result by 8388608 (the 23-bit $\Delta\Sigma$ modulator value, 2^{23}) and remove the fractional portion to determine the value of ME :

$$0.003305288461 \times 8388608 = 27726.769226252288$$

$$ME = 27726 = 110110001001110b \text{ (the value programmed).}$$

Refer to Tables 6 and 7 for the location of the resulting bits in the ME parameter.

Package and Handling Information

Since the device package is sensitive to moisture absorption, it is baked and vacuum packed before shipping. Instructions on the shipping container label regarding exposure to moisture after the container seal is broken must be followed. Otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

The SKY73101-11 is rated to Moisture Sensitivity Level 3 (MSL3) at 260 °C. It can be used for lead or lead-free soldering. For additional information, refer to Skyworks Application Note, *PCB Design and SMT Assembly/Rework Guidelines for MCM-L Packages*, document number 101752.

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. Production quantities of this product are shipped in a standard tape and reel format.

Circuit Design Considerations

The following design considerations are general in nature and must be followed regardless of final use or configuration

1. Paths to ground should be made as short and as low impedance as possible.
2. The ground pad of the SKY73101-11 provides critical electrical grounding requirements. Design the connection to the ground pad to provide the best electrical connection to the circuit board. Multiple vias to the grounding layer are recommended to connect the top layer ground area to the main ground layer.
3. Skyworks recommends including external bypass capacitors on the VDD voltage input (pin 37) of the device. These capacitors should be placed as close as possible to the VDD input pin.
4. A 50 Ω impedance trace is needed for the RF_OUT (pin 10) line.

Electrical and Mechanical Specifications

The absolute maximum ratings of the SKY73101-11 are provided in Table 9. The recommended operating conditions are specified in Table 10 and electrical specifications are provided in Table 11. Spur suppression measurements are provided in Table 12. Measurement plots for single sideband phase noise and settling time are shown in Figures 8 and 9, respectively.

Typical performance characteristics of the SKY73101-11 are illustrated in Figures 10 through 27.

A typical application schematic for the SKY73101-11 is provided in Figure 28. The PCB layout footprint for the SKY73101-11 is provided in Figure 29. Figure 30 shows the package dimensions for the 38-pin MCM and Figure 31 provides the tape and reel dimensions.

Electrostatic Discharge (ESD) Sensitivity

The SKY73101-11 ESD threshold level is 250 VDC for the RF_OUT pin and 2000 VDC for all other pins using Human Body Model (HBM) testing.

To avoid latent or visible ESD damage, always follow proper ESD handling precautions.

Table 9. SKY73101-11 Absolute Maximum Ratings (Note 1)

Parameter	Symbol	Min	Typical	Max	Units
Supply voltage	VCC	0	5.0	5.5	V
Input voltage (CLK, DATA, LE)		0		4.6	V
Operating temperature	T _{OP}	-40		+85	°C
Storage temperature	T _{ST}	-40		+150	°C

Note 1: Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal values. Exceeding any of the limits listed here may result in permanent damage to the device.

CAUTION: Although this device is designed to be as robust as possible, Electrostatic Discharge (ESD) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions should be used at all times. All pins are rated for a Human Body Model (HBM) Class 1A ESD withstand threshold voltage (250 V).

Table 10. SKY73101-11 Recommended Operating Conditions

Parameter	Symbol	Min	Typical	Max	Units
Supply voltage	VCC	4.75	5.00	5.25	V
Input voltage (CLK, DATA, LE) (Note 1): Low level				0.6	V
High level		1.4	3.3	3.6	V
Output voltage (LD) with 18 k Ω load from VCC PLL: Low level, unlocked				0.4	V
High level, unlocked		2.4			V
Reference frequency input voltage (FREF, pin 23)	FREF _{IN}	0.5	1.0	1.5	V _{p-p}
RF output switch enable: High	SWEN _H	2.2			V
Low	SWEN _L			0.8	V
Load connected to RF output		50 Ω , maximum VSWR (load input) 2.0:1, all phases			

Note 1: The CLK, DATA, and LE signals are internally 3.3 V DC. **DO NOT** drive these signals to 5 V.

Table 11. SKY73101-11 Electrical Characteristics (Note 1) (Note 2)**(VCC = 5 V, Tc = 25 °C, Charge Pump Current = 1600 μ A, FREF = 52 MHz, Reference Input Divider = 8, Prescale Divider = 8/9, Unless Otherwise Noted)**

Parameter	Symbol	Test Conditions	Min	Typical	Max	Units
Oscillation frequency			1930		1990	MHz
Reference frequency				13	52	MHz
Phase detector frequency				6.5		MHz
PLL loop bandwidth				25		kHz
Output level			-10	-8.6	-6.0	dBm
Output impedance				50		Ω
Output VSWR					2:1	-
Reference frequency input (FREF) impedance			470			Ω
Harmonic suppression: 2 nd harmonic 3 rd harmonic				-46 -77	-40 -69	dBc dBc
Integrated RMS phase noise		100 Hz to 100 kHz			1	degrees RMS
Single sideband phase noise offset: @ 10 kHz @ 200 kHz @ 400 kHz @ 800 kHz @ 1.8 MHz @ 3.0 MHz @ 6.0 MHz				-85 -121 -132 -139 -146 -150 -155	-80 -114 -124 -135 -142 -146 -151	dBc/Hz dBc/Hz dBc/Hz dBc/Hz dBc/Hz dBc/Hz dBc/Hz
PLL-reference spurious suppression					-100	dBc
Frequency settling time		Within ± 2 kHz		240	375	μ s
Phase settling time		Within ± 5 deg		272	450	μ s
Peak phase error				1.5	5	degrees
Switch isolation			+45	+47		dBc
Current consumption				120	135	mA

Note 1: Performance is guaranteed only under the conditions listed in this Table.**Note 2:** Characterized performance may change if the SKY73101-11 is configured differently than the test conditions specified here. This characterization used a 6.5 MHz fixed comparison frequency for the PLL loop filter. The PLL synthesizer is programmable up to a maximum comparison frequency of 26 MHz but with degraded performance.

Table 12. SKY73101-11 Spur Suppression Measurements

(VCC = 5 V, Tc = 25 °C, Charge Pump Current = 1600 μA, FREF = 52 MHz, Reference Input Divider = 8, Prescale Divider = 8/9, Unless Otherwise Noted)

Spurious Power (kHz)	Frequency (MHz)		
	1930	1960	1990
≥ 200	No spur	No spur	No spur
≥ 400	498.51 kHz, -92 dBc	No spur	No spur
≥ 600	No spur	No spur	No spur
≥ 800	No spur	No spur	No spur
≥ 1000	2575.45 kHz, -95 dBc	No spur	1000.00 kHz, -91 dBc
≥ 3000	No spur	6515.59 kHz, -100 dBc	No spur
