DESCRIPTION:

The QS3390 provides a 16:8 multiplexer logic switch. The low ON resistance (5Ω) of the QS3390 allows inputs to be connected to the outputs without adding propagation delay and without generating additional ground bounce noise.

Mux/Demux devices provide an order of magnitude faster speed than equivalent logic devices.

The QS3390 is characterized for operation at -40°C to +85°C.

POWER SUPPLY CHARACTERISTICS

| Symbol | Parameter | Test Conditions ⁽¹⁾ | Max. | Unit |
|------------------|---|---|------|--------|
| I _{CCQ} | Quiescent Power Supply Current | V _{CC} = Max., V _{IN} = GND or V _{CC} , f = 0 | 3 | μA |
| ΔI _{CC} | Power Supply Current per Input HIGH ⁽²⁾ | V _{CC} = Max., V _{IN} = 3.4V, f = 0 | 1.5 | mA |
| I _{CCD} | Dynamic Power Supply Current per MHz ⁽³⁾ | V _{CC} = Max., A, B, and AB Pins Open, Control Inputs Toggling @ 50% Duty Cycle | 0.25 | mA/MHz |

NOTES:

- For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.
- Per TTL-driven input (V_{IN} = 3.4V, control inputs only). A, B, and AB pins do not contribute to ΔI_{CC}.
- This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The A, B, and AB inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

T_A = -40°C to +85°C, V_{CC} = 5V ± 5%

C_{LOAD} = 50pF, R_{LOAD} = 500Ω unless otherwise noted.

| Symbol | Parameter | Min. ⁽¹⁾ | Typ. | Max. | Unit |
|--------------------------------------|---|---------------------|------|---------------------|------|
| t _{PLH} t _{PHL} | Data Propagation Delay ⁽²⁾ A, B, to/from AB | — | — | 0.25 ⁽³⁾ | ns |
| t _{PZL} t _{PZH} | Switch Turn-On Delay $\overline{A}EN$, $\overline{B}EN$ to A, B, AB | 1.5 | — | 6.5 | ns |
| t _{PLZ} t _{PHZ} | Switch Turn-Off Delay ⁽²⁾ $\overline{A}EN$, $\overline{B}EN$ to A, B, AB | 1.5 | — | 5.5 | ns |

NOTES:

- Minimums are guaranteed but not production tested.
- This parameter is guaranteed but not production tested.
- The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns at C_L = 50pF. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
