## 3.3V SiGe 8-Bit Dual Modulus Programmable Divider/Prescaler with CML Outputs

The NB7N017M is a high speed 8-bit dual modulus programmable divider/prescaler with 16 mA CML outputs capable of switching at input frequencies greater than 3.5 GHz. The CML output structure contains internal 50  $\Omega$  source termination resistor to  $V_{CC}$ . The device generates 400 mV output amplitude with 50  $\Omega$  receiver resistor to  $V_{CC}$ . This I/O structure enables easy implementation of the NB7N017M in 50  $\Omega$  systems.

The differential inputs contain 50  $\Omega$  termination resistors to VT pads and all differential inputs accept RSECL, ECL, LVDS, LVCMOS, LVTTTL, and CML.

Internally, the NB7N017M uses a > 3.5 GHz 8-bit programmable down counter. A select pin, SEL, is used to select between two words, Pa[0:7] and Pb[0:7], that are stored in REGa and REGb respectively. Two parallel load pins, PLa and PLb, are used to load the level triggered programming registers, REGa and REGb, respectively. A differential clock enable, CE, pin is available.

The NB7N017M offers a differential output, TC. Terminal count output, TC, goes high for one clock cycle when the counter has reached the all zeros state. To reduce output phase noise, TC is retimed with the rising edge triggered latches.

1. All high speed inputs and outputs are differential to improve performance.
2. All single-ended inputs are CMOS and NECL/ECL compatible.
3. All V<sub>CC</sub> and V<sub>EE</sub> pins must be externally connected to external power supply voltage to guarantee proper device operation. The thermally exposed pad (EP) on package bottom (see case drawing) must be attached to a heat-sinking conduit. Exposed pad is bonded to the lowest voltage potential, V<sub>EE</sub>.
4. The NC pins are electrically connected to the die and must be left open.
5. CML outputs require 50 Ω receiver termination resistor to V<sub>CC</sub> for proper operation.
6. In the differential configuration when the input termination pins are connected to the common termination voltage, and if no signal is applied then the device will be susceptible to self-oscillation.

## Application Information

All NB7N017M inputs can accept PECL, CML, LVTTTL, LVCMOS and LVDS signal levels. The limitations for differential input signal (LVDS, PECL, or CML) are

minimum input swing of 100 mV and the maximum input swing of 450 mV. Within these conditions, the input voltage can range from  $V_{CC}$  to 1.2 V. Examples interfaces are illustrated below in a 50  $\Omega$  environment ( $Z = 50 \Omega$ ).
