DESCRIPTION

The 74LVC125 is a high performance, low-power, low-voltage Si-gate CMOS device and superior to most advanced CMOS compatible TTL families.

The 74LVC125 consists of four non-inverting buffers/line drivers with 3-State outputs. The 3-State outputs (nY) are controlled by the output enable input (nOE). A HIGH at nOE causes the outputs to assume a high impedance OFF-state.

SYMBOL	PARAMETER	CONDITIONS	TYPICAL	UNIT
t _{PHL} /t _{PLH}	Propagation delay nA to nY	$\begin{array}{l} C_L = 15 \ \text{pF}; \\ V_{CC} = 3.3 \ \text{V} \end{array}$	3.5	ns
Cl	Input capacitance		5.0	pF
C _{PD}	Power dissipation capacitance per buffer	Notes 1 and 2	22	pF

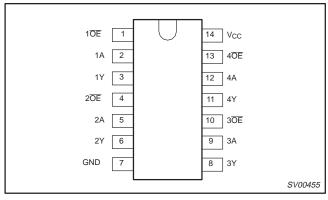

NOTES:

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μ W) $P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o)$ where: f_i = input frequency in MHz; C_L = output load capacity in pF; $\begin{aligned} &f_0 = \text{output frequency in MHz; } V_{CC} = \text{supply voltage in V;} \\ & \Sigma \left(C_L \times V_{CC}^2 \times f_0 \right) = \text{sum of the outputs.} \end{aligned}$

NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
