

## **STLC30R81**

# INTEGRATED RINGING SLIC FOR SHORT LOOP APPLICATIONS

- MONOCHIP SLIC SUITABLE FOR SHORT LOOP APPLICATIONS
- 3.3V SUPPLY
- IMPLEMENTS ALL KEY FEATURES OF THE BORSHT FUNCTION
- DIFFERENTIAL OR SINGLE-ENDED Rx INPUTS
- INTEGRATED TRAPEZOIDAL WAVEFORM RINGING plus SINUSOIDAL and PWM WAVEFORM RINGING CAPABILITY
- TWO SELECTABLE PATH FOR SINUSOIDAL RING INJECTION
- SOFT BATTERY REVERSAL WITH PROGRAMMABLE TRANSITION TIME
- ON HOOK TRANSMISSION
- LOW POWER DISSIPATION IN ALL OPERATING MODES
- AUTOMATIC DUAL BATTERY OPERATION
- LOOP START, GROUND START FEATURES
- SURFACE MOUNT PACKAGE
- -40 TO +85°C OPERATING RANGE
- **■** TEST FUNCTION
- NO EXTERNAL COMPONENTS FOR POWER DISSIPATION

#### **DESCRIPTION**

The STLC30R81 is a low voltage SLIC suitable for short loop applications. All the BORSHT and test

functions (phone detection, loop-back, short circuit detection) are integrated in this derice. It provides three ringing modes: Sinuscidal, Trapezoidal and PWM waveform.

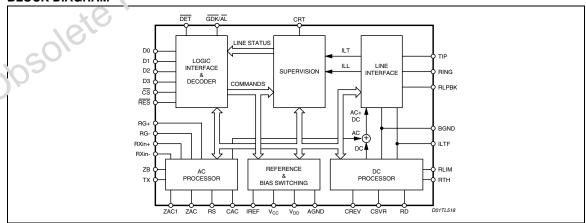

In sinusoidal ringing riodes, depending on the CODEC's functionalines and characteristics Rxin+/Rxinor Rg+/Rg- paths can be selected. When CODEC can manage low frequency signals Rxin+/ Rxin- will be used.

This device can also limit the peak current during On-Hook/Off-Hook transition and Ring-trip detection.

The device is based on BCD3S 90V technology and it can work at 3.3V power supply.

The TQFP44 Package with SLUG increases the SLIC performance in terms of power dissipation making unnecessary the use of any external power components.

## PIN CONNECTION (Top view)

#### **PIN DESCRIPTION**

N°	Pin	Туре	Function	
1	N.C.		No Connection	
2	CSI	In	Chip-Select for input control bits; active low.	
3	D0	In	Control Interface input bit 0. *	
4	DI	In	Control Interface input bit 1. *	
5	D2	In	Control Interface input bit 2. *	
6	D3	In	Control Interface input bit 3. *	
7	RES	In	Reset pin active low	
8	N.C.		No Connection	
9	VDD	In	Control Interface Power Supply	
10	VCC	In	Positive Power Supply.	
11	CRT	-In	GNDK detection capacitor	
12	CREV	ln	Reverse polarity transition time programming capacitor	
13	N.C.		No Connection	
14	VBAT1	In	Negative Battery Supply 1 (-38V Typ)	
15	N.C.		No Connection	
16	VBAT2	In	Negative Battery Supply 2 (-74V Typ)	
17	TX	Out	4 wires output stage (transmitting port)	
18	ZB	In	Canceling input of balance network for 2 to 4 wires conversion.	
19	RS	In	Protection resistors image. It is connected between this node and ZAC	
20	ZAC	In	AC impedance synthesis	
21	ZAC1	In	RX buffer output / AC impedance is connected between this node and ZAC	
22	Rxin+	ln	4 wires input stage (receiving port). A 100K external resistor must be connected to AGND to bias the input stage	
23	Rxin-	In	4 wires input stage (receiving port). A 100K external resistor must be connected to AGND to bias the input stage. If not used must be tied to ground.	

## PIN DESCRIPTION (continued)

N°	Pin	Type	Function	
24	RG+	In	Sinusoidal ring signals input stage. A 100K external resistor must be connected to AGND to bias the input stage	
25	RG-	In	Sinusoidal ring signals input stage. A 100K external resistor must be connected to AGND to bias the input stage. If not used must be tied to ground.	
26	CAC	In	AC feed back input / AC-DC split capacitor is connected between this node and ILTF	
27	RD	In	Ring trip threshold setting resistor	
28	ILTF	In	Transversal Line Current Image	
29	AGND	In	Analog Ground	
30	N.C.		No Connection	
31	RTH	In	Off-Hook threshold programming pin	
32	RLIM	In	Limiting current programming pin	
33	IREF	In	Voltage reference output to generate internal reference current	
34	N.C.		No Connection.	
35	CSVR	In	Battery supply filter capacitor.	
36	N.C.		No Connection	
37	BGND	In	Battery Ground	
38	RING	Out	B wire termination output. IB is the current sunk into this pin.	
39	RLPBK	In	External loop back resistor connects with this pin and tip	
40	N.C.		No Connection.	
41	TIP	Out	A wire termination output. IA is the current sourced from this pin.	
42	N.C.		No Connection.	
43	DET	Out	Off-Hook and Ring-Trip detection bit active low	
44	GDK/AL	Out	Ground-key detection bit active low	

<sup>\*</sup> Input pins provided with 15µA sink to AGND pull-down

## **ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Value	Unit
$V_{BAT}$	Battery voltage	-82 +V <sub>CC</sub>	V
V <sub>CC</sub>	Positive supply voltage	-0.4 to +7	V
$V_{DD}$	Control interface Supply Voltage	-0.4 to +7	V
A/R/BGND	AGND respect BGND	-2 to +2	V

Note: 1. In case of power up, power failure or hot insertion with V<sub>BAT1</sub>, V<sub>CC</sub> present and V<sub>BAT2</sub> floating the Absolute Maximum Rating can be exceeded. This effect can be prevented ensuring that V<sub>BAT2</sub> is always present before V<sub>BAT1</sub> and V<sub>CC</sub> or connecting one schottky diode (e.g. BAT49X or equivalent between .V<sub>BAT1</sub> and V<sub>BAT2</sub>).

## **OPERATING RANGE**

Symbol	Parameter	Value	Unit
T <sub>opt</sub>	Operating temperature range	-40 to 85	°C
V <sub>CC</sub>	Positive supply voltage	3.3 to 3.6	V
V <sub>DD</sub>	Control interface Supply Voltage	3 to 5.5	V
V <sub>BAT1</sub>	Battery voltage	-40 to –22	V
V <sub>BAT2</sub>	Battery voltage	-74 to –65	V
A/BGND	AGND respect BGND	-0.3 to +0.3	V

#### **THERMAL DATA**

Symbol	Parameter	Value	Unit
R <sub>th j-amb</sub>	Thermal resistance Junction to Ambient (2 layer board) Typ.	32	°C/W
R <sub>th j-amb</sub>	Thermal resistance Junction to Ambient (1 layer board) Typ.	56	°C/W

#### **OPERATING MODES**

It is possible to choose several operating modes just setting the proper Input D0, D1, D2, and D3. The table below (Tab.1) shows these modes:

Table 1. Ctrl Interface

	Inputs			Operating Mode	Operating Mode Output	
D0	D1	D2	D3		DET	GDK/AL
0	0	0	0	Power down	Disable	Disable
0	0	0	1	Power down	Disable	Disable
1	1	0	1	Power down	Disable	Disable
0	0	1	0	Stand-by	Off-Hook	Gnd-Key
0	1	0	0	Active normal polarity	Off-Hook	Gnd-Key
0	1	1	0	Active reverse polarity	Off-Hook	Gnd-Key
1	0	0	0	Trapezoidal ringing normal polarity	Ringing trip	Gnd-Key
1	0	1	0	Trapezoidal ringing reverse polarity	Ringing trip	Gnd-Key
1	1	0	0	Ground start	Off-Hook	Gnd-Key
1	1	1	0	High impedance feeding	Off-Hook	Disable
0	1	0	1	Active normal polarity (On-Hook transmission)	Off-Hook	Gnd-Key
0	1	1	1	Active reverse polarity (On-Hook transmission)	Off-Hook	Gnd-Key
1	0	0	1	Ringing In Sinusoidal (or PWM) wave Rxin+/- In	Ringing trip	Gnd-Key
1	0	1	1	Ringing In Sinusoidal (or PWM) wave Rg+/- In	Ringing trip	Gnd-Key
	0110	⇒1110		Test mode: phone detection	Phone detect	Disable
0	0	1	1	Test mode: loop back	Off-Hook	Disable
1	1	1	1	Test mode: short circuit detection	Phone short	Disable

#### **Power Down**

It's an idle state characterized by very low power consumption; any functionality is disabled. It can be set during out of service periods just to reduce the power consumption.

It is worth remarking that two other conditions can set the SLIC in IDLE state but with some differences as reported in the table below.

Table 2. Power down

IDLE STATE	DET	GDK/AL
Power down command	Disable	Disable
Reset	Disable	Disable
Thermal alarm	Low	Low

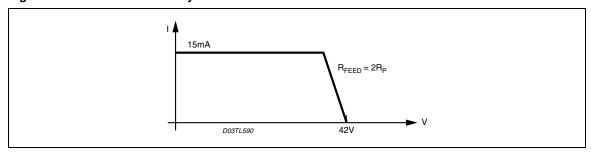

## Stand By

Mode selected in On-Hook condition when high immunity to the common mode currents is needed to prevent false Off-Hook detection. To reduce the current consumption, AC feedback loop is disabled. Only DET and

**477** 

GDK/AL detectors are active. DC line loop current is limited at 15mA (not programmable). DC characteristic is shown in Fig.1. The line feeding voltage in On-Hook is typically 42V @ VBAT2 = -74V.

Figure 1. Characteristic in StBy Mode

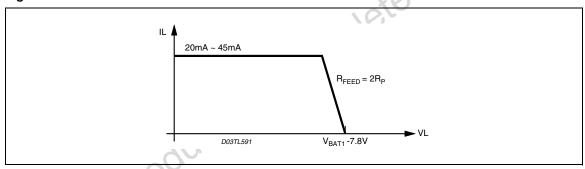

#### Active - NP (normal polarity) or RP (reverse polarity)

Mode selected to allow voice signal transmission. When in ACTIVE mode  $V_{BAT1}$  is selected automatically and the voltage drop in on-hook condition is 7.8V. Concerning AC characteristic the STLC30R81 allows to set 2Wire termination impedance by means of external scaled impedance.

In ACTIVE mode the SLIC can perform battery reversal in a soft way, with programmable transition time, without affecting the AC signal transmission. It is possible to program, by means of an external resistor RLIM, the value of the current limitation in a range of 20 to 45mA. During On/Off-Hook transition, the SLIC line drivers limit the transient current at Ilim +13mA.

Figure 2. DC Characteristic in Active mode

#### **Active - ON-Hook transmission**

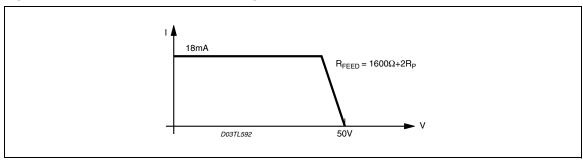

This mode is selected to allow caller ID transmission in On-Hook line condition. The line feeding voltage in On-Hook transmission is  $42V @ V_{BAT2} = -74V$ .

#### **High Impedance feeding**

As in Stand-By, this mode is set in On-Hook condition, with further reduced power consumption. Higher power efficiency turns back to a lower immunity of the Off-Hook detector to line common mode currents. The DC feeding shows a constant current characteristic (Ilim = 18mA) followed by a resistive range with an equivalent series resistance Rfeed =  $1600\Omega+2Rp$  (Fig.3). The line feeding voltage in On-Hook is  $50V @ V_{BAT2} = -74$ 

Thermal protection circuit is still active, preventing the junction temperature, in case of fault condition, to exceed 150°C. In High Impedance Feeding most of the circuit is switched off, only the circuit, dedicated to Off-Hook detection, is powered. This allows reducing the total power consumption in On-hook to 30mW (typical).

Figure 3. DC Characteristic in Hi-Z Feeding

#### RINGING

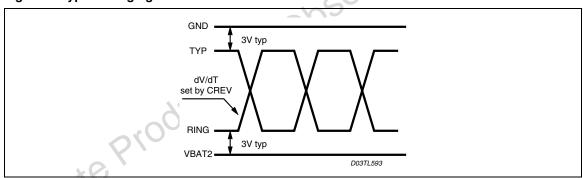

The STLC30R81 can provide three kind of signal waveform modes: Sinusoidal, trapezoidal, PWM. When this mode is selected, the SLIC is switched to VBAT2 (-74V); both DC/AC feedback loop are disabled and the SLIC line drivers operate as voltage buffers.

### **Trapezoidal Ringing Waveform**

The ring waveform is obtained toggling the D2 control bit at the desired ring frequency. This bit in facts, controls the line polarity: 0 = direct, 1 = reverse. The transition between the two polarities is performed in a "soft" way. This means that TIP and RING wire exchange their polarities following a ramp transition (see Fig.4).

The CREV is capacitor sets the shape of the ringing trapezoidal waveform. Once ring trip is detected, the DET output is set low and remains latched keeping the STLC30R81 in Stand-by mode until the operative mode is modified by any Input Word.

**Figure 4. Typical Ringing Waveform** 

CREV	Crest Factor @ 20Hz	Crest Factor @ 25Hz
22nF	1.2	1.26
27nF	1.25	1.32
33nF	1.33	Not significant (*)

<sup>\*</sup> Distortion already less than 10%

#### **Sinusoidal Ringing Waveform**

The STLC30R81 has two couple of inputs: Rxin+/Rxin- and Rg+/Rg-; this means that it is possible to select two different paths to generate the sinusoidal waveform ringing.

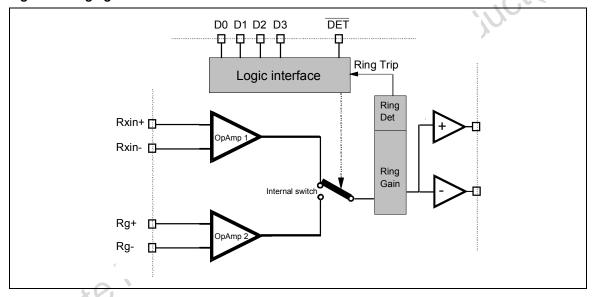

- Selecting Rxin+/Rxin- (first path), the sinusoidal waveform can be applied in differential mode (using both inputs) or single ended mode (connecting one of the two input pins directly to the GND). This signal comes from STLC5048 or other Codec
- Selecting Rg+/Rg- (second path), the sinusoidal (or PWM) waveform ringing, can be applied in differential mode (using both inputs) or single ended mode (connecting one of the two input pins directly to the GND). The ring source (codec, waveform generators) can be always active and shared by multiple lines.

Both DC/AC feedback loops are disabled except for the first path (Rxin+/Rxin-) that remains enabled. This functionality will be managed through an "Input Word" that allows the ringing signal, to flow through the line. The Table 3 shows how to select the proper input word.

**Table 3. Control Word** 

	Conti	ol Word		Input Selected Mode	
D0	D1	D2	D3	input Selected Mode	
1	0	0	1	Rxin+/ Rxin- Input selected	
1	0	1	1	Rg+/Rg- Input selected	

Figure 5. Ringing internal block

In On-Hook condition, Tip and Ring are biased at -VBAT2/2; the input signal is typically amplified at 35dB.

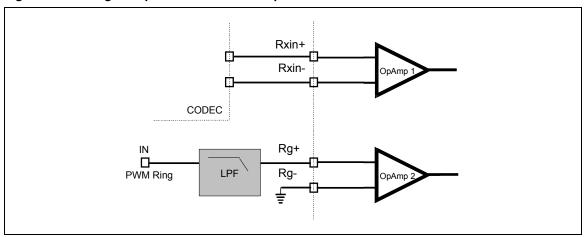

Ring trip detection is performed sensing the variation of the AC line impedance from High (On-Hook) to Low (Off-Hook). This particular ring trip method, allows to operate without DC offset superimposed on the ring signal and therefore, obtain the maximum possible load driving capability, from a given negative battery. After Ring/Trip detection, DET pin is set Low and remains latched keeping the STLC30R81 in Stand-by mode until the operative mode is modified by Input Word.

#### **PWM Ringing Waveform**

A pulse-width modulated (PWM) signal may be used to provide the ringing input to Rg inputs. The signal is applied through a low-pass filter and AC-coupled into Rg+. This approach gives a sine wave output at tip and ringing circuit.

**477** 

Figure 6. PWM signal Input vs Sinusoidal Output

#### **GROUND START**

This mode is selected when the SLIC is adopted in a system using the Ground Start feature. In this mode, the TIP termination is set in High Impedance (  $100 \mathrm{K}\Omega$ ) while the RING one is active and fixed at -33V @ Vbat1 (= -38V). In case RING termination is connected to GND the sinked current is limited to 35mA. When RING is connected to GND both Off-Hook and Ground-Key detectors are set low.

Obsolete

#### **TEST MODES**

This device can provide three kind of tests:

- 1. Phone Detection
- 2. Short circuit
- 3. Loop back

#### **Phone Detection**

This test feature checks whether a phone is connected to the line.

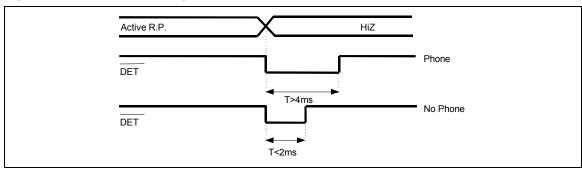

Starting from Active Reverse Polarity status, just changing the D0 input bit, it is possible to perform the Phone Detection function.

The MCU measures the time span of DET. Time longer then 4ms indicates that a phone is hooked up with the line, if no phone is connected, the time span is less than 2ms.

Table 4. Phone detection - D0 variation

102	Conti	ol Word		Operating Mode	
D0	D1	D2	D3	Operating mode	
0	1	1	0	Active - Reverse Polarity	
1	1	1	0	High Impedance Feeding - Normal Polarity	

Figure 7. Phone detection Diagram

#### **Short Circuit**

DET signal pin changes its logical level depending on the presence (or not) of short circuit at the output of the Line Card (See Tab.5).

**Table 5. Short Circuit Detection** 

	Control Word			DI	ET
D0	D1	D2	D3	Short Circuit	No Short Circuit
1	1	1	1	0	1

#### Loop back

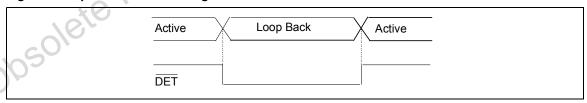

The test is aimed at cheking detection and feeding circuitry functionalities as described in fig. 8. The external resistor RLPCK is closed internally between TIP and RING and emulates the phone resistance. Starting from ACTIVE mode, when loop back mode is selected DET pin will change its level.

If DET pin is low it means that detection and feeding circuits work properly. If DET remains high it means that a failure has been detected.

**Table 6. Loop Back Detection** 

	Cont	rol Word		DI	ET
D0	D1	D2	D3	Good	Fail
0	0	1	7	0	1

Figure 8. loop back detection diagram

#### **Protection Mode**

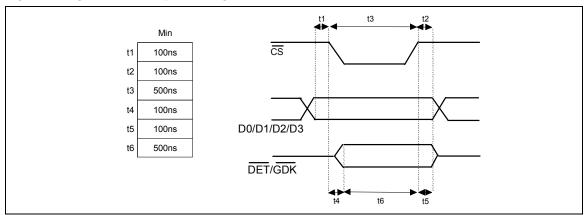

Suggested protection circuit is based on programmable LCP1521S Trisil and the surge current is limited by the resistors R<sub>PT2</sub> and R<sub>PR2</sub>, which are PTC types, protecting the device against both lightning and power-cross.

Thermal overload: the integrated thermal protection is activated when  $T_j$  reaches 150°C typ.; the Slic is forced in Power-down mode, DET and AL are set Low.

For external applications, two diodes 1N4148 are suggested (Pls. see application diagram).
