8-bit high-speed analog-to-digital converter

TDA8714

FEATURES

- 8-bit resolution
- Sampling rate up to 80 MHz
- No missing codes guaranteed
- High signal-to-noise ratio over a large analog input frequency range (7.7 effective bits at 4.43 MHz full-scale input at $f_{\text{clk}} = 80$ MHz)
- Overflow/underflow 3-state TTL output
- TTL compatible digital inputs
- Low-level AC clock input signal allowed
- External reference voltage regulator
- Power dissipation only 340 mW (typical)
- Low analog input capacitance, no buffer amplifier required
- No sample-and-hold circuit required.

APPLICATIONS

High-speed analog-to-digital conversion for:

- video data digitizing
- radar pulse analysis
- transient signal analysis
- high energy physics research
- $\Sigma\Delta$ modulators
- medical imaging.

GENERAL DESCRIPTION

The TDA8714 is an 8-bit high-speed Analog-to-Digital Converter (ADC) for professional video and other applications. It converts the analog input signal into 8-bit binary-coded digital words at a maximum sampling rate of 80 MHz. All digital inputs and outputs are TTL compatible, although a low-level sine wave clock input signal is allowed.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{CCA}	analog supply voltage		4.75	5.0	5.25	V
V_{CCD}	digital supply voltage		4.75	5.0	5.25	V
V_{CCO}	output stages supply voltage		4.75	5.0	5.25	V
I_{CCA}	analog supply current		–	25	30	mA
I_{CCD}	digital supply current		–	27	33	mA
I_{CCO}	output stages supply current		–	16	20	mA
INL	DC integral non-linearity		–	± 0.4	± 0.5	LSB
DNL	DC differential non-linearity		–	± 0.2	± 0.35	LSB
AINL	AC integral non-linearity	note 1	–	± 0.5	± 1.0	LSB
$f_{\text{clk(max)}}$	maximum clock frequency					
	TDA8714/7		80	–	–	MHz
	TDA8714/6		60	–	–	MHz
	TDA8714/4		40	–	–	MHz
P_{tot}	total power dissipation		–	340	435	mW

Note

1. Full-scale sine wave ($f_i = 4.43$ MHz; $f_{\text{clk}} = 80$ MHz).

TDA8714

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{CCA}	analog supply voltage	note 1	-0.3	+7.0	V
V_{CCD}	digital supply voltage	note 1	-0.3	+7.0	V
V_{CCO}	output stages supply voltage	note 1	-0.3	+7.0	V
ΔV_{CC}	supply voltage differences between V_{CCA} and V_{CCD}		-1.0	+1.0	V
ΔV_{CC}	supply voltage differences between V_{CCO} and V_{CCD}		-1.0	+1.0	V
ΔV_{CC}	supply voltage differences between V_{CCA} and V_{CCO}		-1.0	+1.0	V
V_I	input voltage	referenced to AGND	-0.3	+7.0	V
$V_{clk(p-p)}$	AC input voltage for switching (peak-to-peak value)	referenced to DGND	-	V_{CCD}	V
I_O	output current		-	10	mA
T_{stg}	storage temperature		-55	+150	°C
T_{amb}	operating ambient temperature		0	+70	°C
T_j	junction temperature		-	+150	°C

Note

- The supply voltages V_{CCA} and V_{CCD} may have any value between -0.3 V and +7.0 V provided the difference between V_{CCA} and V_{CCD} is between -1 V and +1 V.

HANDLING

Inputs and outputs are protected against electrostatic discharges in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling integrated circuits.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j-a}$	thermal resistance from junction to ambient in free air		
	SOT137-1	75	K/W
	SOT340-1	119	K/W

8-bit high-speed analog-to-digital converter

TDA8714

CHARACTERISTICS

$V_{CCA} = V_7$ to $V_6 = 4.75$ to 5.25 V; $V_{CCD} = V_{18}$ to $V_{17} = 4.75$ to 5.25 V; $V_{CCO} = V_{19}$ and V_{21} to $V_{20} = 4.75$ to 5.25 V; AGND and DGND shorted together; V_{CCA} to $V_{CCD} = -0.25$ to $+0.25$ V; V_{CCO} to $V_{CCD} = -0.25$ to $+0.25$ V; V_{CCA} to $V_{CCO} = -0.25$ to $+0.25$ V; $V_{i(p-p)} = 1.75$ V; $T_{amb} = 0$ to $+70$ °C; typical values measured at $V_{CCA} = V_{CCD} = V_{CCO} = 5$ V and $T_{amb} = 25$ °C; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supply						
V_{CCA}	analog supply voltage		4.75	5.0	5.25	V
V_{CCD}	digital supply voltage		4.75	5.0	5.25	V
V_{CCO}	output stages supply voltage		4.75	5.0	5.25	V
I_{CCA}	analog supply current		–	25	30	mA
I_{CCD}	digital supply current		–	27	33	mA
I_{CCO}	output stages supply current		–	16	20	mA
Inputs						
CLOCK INPUT CLK (REFERENCED TO DGND); note 1

TDA8714

Notes to the characteristics

1. In addition to a good layout of the digital and analog ground, it is recommended that the rise and fall times of the clock must not be less than 1 ns.
2. Analog input voltages producing code 00 up to and including FF:
 - a) V_{osB} (voltage offset BOTTOM) is the difference between the analog input which produces data equal to 00 and the reference voltage BOTTOM (V_{RB}) at $T_{amb} = 25\text{ }^{\circ}\text{C}$.
 - b) V_{osT} (voltage offset TOP) is the difference between V_{RT} (reference voltage TOP) and the analog input which produces data outputs equal to FF at $T_{amb} = 25\text{ }^{\circ}\text{C}$.
3. Full-scale sine wave ($f_i = 4.43\text{ MHz}$; $f_{clk} = 80\text{ MHz}$).
4. The analog bandwidth is defined as the maximum input sine wave frequency which can be applied to the device. No glitches greater than 2 LSBs, neither any significant attenuation are observed in the reconstructed signal.
5. The analog input settling time is the minimum time required for the input signal to be stabilized after a sharp full-scale input (square-wave signal) in order to sample the signal and obtain correct output data.
6. Effective bits are obtained via a Fast Fourier Transform (FFT) treatment taking 8K acquisition points per equivalent fundamental period. The calculation takes into account all harmonics and noise up to half of the clock frequency (NYQUIST frequency). Conversion to signal-to-noise ratio: $S/N = EB \times 6.02 + 1.76\text{ dB}$.
7. Intermodulation measured relative to either tone with analog input frequencies of 4.43 MHz and 4.53 MHz. The two input signals have the same amplitude and the total amplitude of both signals provides full scale to the converter.
8. Measurement carried out using video analyser VM700A where the video analog signal is reconstructed through a digital-to-analog converter.
9. Output data acquisition: the output data is available after the maximum delay time of t_d ; in the event of 80 MHz clock operation, the hardware design must take into account the t_d and t_h limits with respect to the input characteristics of the acquisition circuit.

APPLICATION INFORMATION

The analog and digital supplies should be separated and decoupled.

The external voltage generator must be built such that a good supply voltage ripple rejection is achieved with respect to the LSB value.

(1) V_{RB} and V_{RT} are decoupled to AGND.

(2) Pin 5 should be connected to AGND; pins 3 and 10 to DGND in order to prevent noise influence.

TDA8714

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all SO and SSOP packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

SO

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

SSOP

Wave soldering is **not** recommended for SSOP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The longitudinal axis of the package footprint must be parallel to the solder flow and must incorporate solder thieves at the downstream end.**

Even with these conditions, only consider wave soldering SSOP packages that have a body width of 4.4 mm, that is SSOP16 (SOT369-1) or SSOP20 (SOT266-1).

METHOD (SO AND SSOP)

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

TDA8714

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
