PCA9533 4-bit I²C LED dimmer

Product data sheet
Supersedes data of 2003 Sep 19

2004 Oct 01

4-bit I²C LED dimmer

PCA9533

FEATURES

- 4 LED drivers (on, off, flashing at a programmable rate)
- 2 selectable, fully programmable blink rates (frequency and duty cycle) between 0.591 Hz and 152 Hz (1.69 seconds and 6.58 milliseconds)
- 256 brightness steps
- Input/outputs not used as LED drivers can be used as regular GPIOs
- Internal oscillator requires no external components
- I²C interface logic compatible with SMBus
- Internal power-on reset
- Noise filter on SCL/SDA inputs
- 4 open drain outputs directly drive LEDs to 25 mA
- Edge rate control on outputs
- No glitch on power-up
- Supports hot insertion
- Low stand-by current
- Operating power supply voltage range of 2.3 V to 5.5 V
- 0 to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 150 V MM per JESD22-A115 and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JEDEC Standard JESD78 which exceeds 100 mA
- Packages offered: SO8, TSSOP8 (MSOP8)

DESCRIPTION

The PCA9533 is a 4-bit I²C and SMBus I/O expander optimized for dimming LEDs in 256 discrete steps for Red/Green/Blue (RGB) color mixing and back light applications.

The PCA9533 contains an internal oscillator with two user programmable blink rates and duty cycles coupled to the output PWM. The LED brightness is controlled by setting the blink rate high enough (> 100 Hz) that the blinking cannot be seen and then using

the duty cycle to vary the amount of time the LED is on and thus the average current through the LED.

The initial setup sequence programs the two blink rates/duty cycles for each individual PWM. From then on, only one command from the bus master is required to turn individual LEDs ON, OFF, BLINK RATE 1 or BLINK RATE 2. Based on the programmed frequency and duty cycle, BLINK RATE 1 and BLINK RATE 2 will cause the LEDs to appear at a different brightness or blink at periods up to 1.69 second. The open drain outputs directly drive the LEDs with maximum output sink current of 25 mA per bit and 100 mA per package.

To blink LEDs at periods greater than 1.69 second the bus master (MCU, MPU, DSP, chipset, etc.) must send repeated commands to turn the LED on and off as is currently done when using normal I/O Expanders like the Philips PCF8574 or PCA9554. Any bits not used for controlling the LEDs can be used for General Purpose Parallel Input/Output (GPIO) expansion which provides a simple solution when additional I/O is needed for ACPI power switches, sensors, pushbuttons, alarm monitoring, fans, etc.

Power-On Reset (POR) initializes the registers to their default state causing the bits to be set HIGH (LED off).

Due to pin limitations, the PCA9533 is not featured with hardware address pins. The PCA9533/01 and the PCA9533/02 have different fixed I²C addresses allowing operation of both on the same bus.

PIN CONFIGURATION

Figure 1. Pin configuration

PIN DESCRIPTION

PIN NUMBER	SYMBOL	FUNCTION
1	LED0	LED driver 0
2	LED1	LED driver 1
3	LED2	LED driver 2
4	V _{SS}	Supply ground
5	LED3	LED driver 3
6	SCL	Serial clock line
7	SDA	Serial data line
8	V _{DD}	Supply voltage

BLOCK DIAGRAM

Figure 2. Block diagram

4-bit I²C LED dimmer

PCA9533

DEVICE ADDRESSING

Following a START condition the bus master must output the address of the slave it is accessing. The address of the PCA9533/01 is shown in Figure 3 and PCA9533/02 in Figure 4.

Figure 3. Slave address — PCA9533/01

Figure 4. Slave address — PCA9533/02

The last bit of the address byte defines the operation to be performed. When set to logic 1 a read is selected while a logic 0 selects a write operation.

CONTROL REGISTER

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9533 which will be stored in the Control Register.

Figure 5. Control register

The lowest 3 bits are used as a pointer to determine which register will be accessed.

If the auto-increment flag is set, the three low order bits of the Control Register are automatically incremented after a read or write. This allows the user to program the registers sequentially. The contents of these bits will rollover to '000' after the last register is accessed.

When auto-increment flag is set (AI = 1) and a read sequence is initiated, the sequence must start by reading a register different from the input register (B2 B1 B0 ≠ 0 0 0).

Only the 3 least significant bits are affected by the AI flag.

Unused bits must be programmed with zeroes.

CONTROL REGISTER DEFINITION

B2	B1	B0	REGISTER NAME	TYPE	REGISTER FUNCTION
0	0	0	INPUT	READ	INPUT REGISTER
0	0	1	PSC0	READ/ WRITE	FREQUENCY PRESCALER 0
0	1	0	PWM0	READ/ WRITE	PWM REGISTER 0
0	1	1	PSC1	READ/ WRITE	FREQUENCY PRESCALER 1
1	0	0	PWM1	READ/ WRITE	PWM REGISTER 1
1	0	1	LS0	READ/ WRITE	LED SELECTOR

REGISTER DESCRIPTION

INPUT — INPUT REGISTER

					LED 3	LED 2	LED 1	LED 0
bit	7	6	5	4	3	2	1	0
Default	0	0	0	0	X	X	X	X

The INPUT register reflects the state of the device pins. Writes to this register will be acknowledged but will have no effect.

NOTE: The default value "X" is determined by the externally applied logic level, normally '1' when used for directly driving LED with pull-up to V_{DD}.

PSC0 — FREQUENCY PRESCALER 0

bit	7	6	5	4	3	2	1	0
default	0	0	0	0	0	0	0	0

PSC0 is used to program the period of the PWM output.

$$\text{The period of BLINK0} = \frac{(\text{PSC0} + 1)}{152}$$

PWM0 — PWM REGISTER 0

bit	7	6	5	4	3	2	1	0
default	1	0	0	0	0	0	0	0

The PWM0 register determines the duty cycle of BLINK0. The outputs are LOW (LED on) when the count is less than the value in PWM0 and HIGH (LED off) when it is greater. If PWM0 is programmed with 00h, then the PWM0 output is always HIGH (LED off).

$$\text{The duty cycle of BLINK0 is: } \frac{\text{PWM0}}{256}$$

PSC1 — FREQUENCY PRESCALER 1

bit	7	6	5	4	3	2	1	0
default	0	0	0	0	0	0	0	0

PSC1 is used to program the period of PWM output.

$$\text{The period of BLINK1} = \frac{(\text{PSC1} + 1)}{152}$$

4-bit I²C LED dimmer

PCA9533

PWM1 — PWM REGISTER 1

bit	7	6	5	4	3	2	1	0
default	1	0	0	0	0	0	0	0

The PWM1 register determines the duty cycle of BLINK1. The outputs are LOW (LED on) when the count is less than the value in PWM1 and HIGH (LED off) when it is greater. If PWM1 is programmed with 00h, then the PWM1 output is always HIGH (LED off).

The duty cycle of BLINK1 is: $\frac{\text{PWM1}}{256}$

LS0 — LED SELECTOR

	LED3		LED2		LED 1		LED 0	
bit	7	6	5	4	3	2	1	0
default	0	0	0	0	0	0	0	0

The LSx LED select registers determine the source of the LED data.

- 00 = Output is set Hi-Z (LED off – default)
- 01 = Output is set LOW (LED on)
- 10 = Output blinks at PWM0 rate
- 11 = Output blinks at PWM1 rate

PINS USED AS GENERAL PURPOSE I/Os

LED pins not used to control LEDs can be used as general purpose I/Os.

For use as input: Set LEDx to high-impedance (00) and then read the pin state via the input register.

For use as output: Connect external pull-up resistor to the pin and size it according to the DC recommended operating characteristics. LED output pin is HIGH when the output is programmed as high-impedance, and LOW when the output is programmed LOW through the “LED selector” register. The output can be pulse-width controlled when PWM0 or PWM1 are used.

POWER-ON RESET

When power is applied to V_{DD}, an internal Power-On Reset holds the PCA9533 in a reset condition until V_{DD} has reached V_{POR}. At this point, the reset condition is released and the PCA9533 registers are initialized to their default states, with all outputs in the off state. Thereafter, V_{DD} must be lowered below 0.2 V to reset the device.

4-bit I²C LED dimmer

PCA9533

CHARACTERISTICS OF THE I²C-BUS

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Figure 6).

Figure 6. Bit transfer

Start and stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the start condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the stop condition (P) (see Figure 7).

System configuration

A device generating a message is a transmitter: a device receiving is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves (see Figure 8).

Figure 7. Definition of start and stop conditions

Figure 8. System configuration

4-bit I²C LED dimmer

PCA9533

Acknowledge

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse, set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a stop condition.

PCA9533

APPLICATION DATA

Figure 13. Typical application

Minimizing I_{DD} when the I/O is used to control LEDs

When the I/Os are used to control LEDs, they are normally connected to V_{DD} through a resistor as shown in Figure 13. Since the LED acts as a diode, when the LED is off the I/O V_{IN} is about 1.2 V less than V_{DD}. The supply current, I_{DD}, increases as V_{IN} becomes lower than V_{DD} and is specified as ΔI_{DD} in the DC characteristics table.

Designs needing to minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to V_{DD} when the LED is off. Figure 14 shows a high value resistor in parallel with the LED. Figure 15 shows V_{DD} less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O V_{IN} at or above V_{DD} and prevents additional supply current consumption when the LED is off.

Figure 14. High value resistor in parallel with the LED

Figure 15. Device supplied by a lower voltage

4-bit I²C LED dimmer

PCA9533

Programming example

The following example will show how to set LED0 and LED1 off. It will set LED2 to blink at 1 Hz, 50 % duty cycle. LED3 will be set to be dimmed at 25 % of their maximum brightness (duty cycle = 25 %). PCA9533/01 is used in this example.

Table 1.

	I ² C-bus
Start	S
PCA9533 address	C4h
PSC0 subaddress + auto-increment	11h
Set prescaler PSC0 to achieve a period of 1 second: $\text{Blink period} = 1 = \frac{\text{PSC0} + 1}{152}$ PSC0 = 151	97h
Set PWM0 duty cycle to 50 %: $\frac{\text{PWM0}}{256} = 0.5$ PWM0 = 128	80h
Set prescaler PWM1 to dim at maximum frequency Blink period = maximum PSC1 = 0	00h
Set PWM1 output duty cycle to 25 %: $\frac{\text{PWM1}}{256} = 0.25$ PWM1 = 64	40h
Set LED0 on, LED1 off, LED2 set to blink at PSC0, PWM0, LED3 set to blink at PCS1, PWM1	E1h
Stop	P

ABSOLUTE MAXIMUM RATINGS

In accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN	MAX	UNIT
V _{DD}	Supply voltage		-0.5	6.0	V
V _{I/O}	DC voltage on an I/O		V _{SS} - 0.5	5.5	V
I _{I/O}	DC output current on an I/O		—	+25	mA
I _{SS}	Supply current		—	100	mA
P _{tot}	Total power dissipation		—	400	mW
T _{stg}	Storage temperature range		-65	+150	°C
T _{amb}	Operating ambient temperature		-40	+85	°C

HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take precautions appropriate to handling MOS devices. Advice can be found in Data Handbook IC24 under "Handling MOS devices".

DC CHARACTERISTICSV_{DD} = 2.3 V to 5.5 V; V_{SS} = 0 V; T_{amb} = -40 °C to +85 °C; unless otherwise specified. TYP at 3.3 V and 25 °C.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
Supplies						
V _{DD}	Supply voltage		2.3	—	5.5	V
I _{DD}	Supply current	Operating mode; V _{DD} = 5.5 V; no load; V _I = V _{DD} or V _{SS} ; f _{SCL} = 100 kHz	—	350	500	μA
I _{stb}	Standby current	Standby mode; V _{DD} = 5.5 V; no load; V _I = V _{DD} or V _{SS} ; f _{SCL} = 0 kHz	—	1.9	3.0	μA
ΔI _{DD}	Additional standby current	Standby mode; V _{DD} = 5.5 V; Every LED I/O at V _{IN} = 4.3 V; f _{SCL} = 0 kHz	—	—	325	μA
V _{POR}	Power-on reset voltage (Note 1)	No load; V _I = V _{DD} or V _{SS}	—	1.7	2.2	V
Input SCL; input/output SDA						
V _{IL}	LOW-level input voltage		-0.5	—	0.3V _{DD}	V
V _{IH}	HIGH-level input voltage		0.7V _{DD}	—	5.5	V
I _{OL}	LOW-level output current	V _{OL} = 0.4 V	3	6.5	—	mA
I _L	Leakage current	V _I = V _{DD} = V _{SS}	-1	—	+1	μA
C _I	Input capacitance	V _I = V _{SS}	—	3.7	5	pF
I/Os						
V _{IL}	LOW-level input voltage		-0.5	—	0.8	V
V _{IH}	HIGH-level input voltage		2.0	—	5.5	V
I _{OL}	LOW-level output current	V _{OL} = 0.4 V; V _{DD} = 2.3 V; Note 2	9	—	—	mA
		V _{OL} = 0.4 V; V _{DD} = 3.0 V; Note 2	12	—	—	mA
		V _{OL} = 0.4 V; V _{DD} = 5.0 V; Note 2	15	—	—	mA
		V _{OL} = 0.7 V; V _{DD} = 2.3 V; Note 2	15	—	—	mA
		V _{OL} = 0.7 V; V _{DD} = 3.0 V; Note 2	20	—	—	mA
		V _{OL} = 0.7 V; V _{DD} = 5.0 V; Note 2	25	—	—	mA
I _L	Input leakage current	V _{DD} = 3.6 V; V _I = 0 V or V _{DD}	-1	—	1	μA
C _{IO}	Input/output capacitance		—	2.1	5	pF

NOTES:

- V_{DD} must be lowered to 0.2 V in order to reset part.
- Each I/O must be externally limited to a maximum of 25 mA and the device must be limited to a maximum current of 100 mA.

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specifications defined by Philips. This specification can be ordered using the code 9398 393 40011.

Data sheet status

Level	Data sheet status ^[1]	Product status ^[2] [3]	Definitions
I	Objective data sheet	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data sheet	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data sheet	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

[3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products—including circuits, standard cells, and/or software—described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
