

PCA9557 8-bit I²C-bus and SMBus I/O port with reset Rev. 05 — 12 September 2007

Product data sheet

1. General description

The PCA9557 is a silicon CMOS circuit which provides parallel input/output expansion for SMBus and I²C-bus applications. The PCA9557 consists of an 8-bit input port register, 8-bit output port register, and an I²C-bus/SMBus interface. It has low current consumption and a high-impedance open-drain output pin, IO0.

The system master can enable the PCA9557's I/O as either input or output by writing to the configuration register. The system master can also invert the PCA9557 inputs by writing to the active HIGH polarity inversion register. Finally, the system master can reset the PCA9557 in the event of a time-out by asserting a LOW in the reset input.

The power-on reset puts the registers in their default state and initializes the I^2C -bus/SMBus state machine. The RESET pin causes the same reset/initialization to occur without de-powering the part.

2. Features

- Lower voltage, higher performance migration path for the PCA9556
- 8 general purpose input/output expander/collector
- Input/output configuration register
- Active HIGH polarity inversion register
- I²C-bus and SMBus interface logic
- Internal power-on reset
- Noise filter on SCL/SDA inputs
- Active LOW reset input
- 3 address pins allowing up to 8 devices on the I²C-bus/SMBus
- High-impedance open-drain on IO0
- No glitch on power-up
- Power-up with all channels configured as inputs
- Low standby current
- Operating power supply voltage range of 2.3 V to 5.5 V
- 5 V tolerant inputs/outputs
- 0 kHz to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 200 V MM per JESD22-A115 and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JEDEC Standard JESD78 which exceeds 100 mA
- Three packages offered: SO16, TSSOP16, HVQFN16

3. Ordering information

Table 1. Orde	ering inform	ation						
Type number	Package	Package						
	Name	Description	Version					
PCA9557D	SO16	plastic small outline package; 16 leads; body width 3.9 mm	SOT109-1					
PCA9557PW	TSSOP16	plastic thin shrink small outline package; 16 leads; body width 4.4 mm	SOT403-1					
PCA9557BS	HVQFN16	plastic thermal enhanced very thin quad flat package; no leads; 16 terminals; body $4 \times 4 \times 0.85$ mm	SOT629-1					

3.1 Ordering options

Table 2. Ord	ering options	
Type number	Topside mark	Temperature range
PCA9557D	PCA9557D	$T_{amb} = -40 ^{\circ}\text{C} \text{ to } +85 ^{\circ}\text{C}$
PCA9557PW	PCA9557	$T_{amb} = -40 ^{\circ}\text{C} \text{ to } +85 ^{\circ}\text{C}$
PCA9557BS	9557	$T_{amb} = -40 ^{\circ}\text{C} \text{ to } +85 ^{\circ}\text{C}$

5. Pinning information

5.1 Pinning

5.2 Pin description

Table 3.Pin description

Symbol	Pin		Description
	SO16, TSSOP16	HVQFN16	
SCL	1	15	serial clock line
SDA	2	16	serial data line
A0	3	1	address input 0
A1	4	2	address input 1
A2	5	3	address input 2
IO0	6	4	input/output 0 (open-drain)
IO1	7	5	input/output 1

Table 3.	Pin de	scriptioncontinued	d					
Symbol		Pin		Description				
		SO16, TSSOP16	HVQFN16					
V _{SS}		8	6 <mark>[1]</mark>	supply ground				
IO2		9	7	input/output 2				
IO3		10	8	input/output 3				
IO4		11	9	input/output 4				
105		12	10	input/output 5				
IO6		13	11	input/output 6				
107		14	12	input/output 7				
RESET		15	13	active LOW reset input				
V _{DD}		16	14	supply voltage				

[1] HVQFN package die supply ground is connected to both the V_{SS} pin and the exposed center pad. The V_{SS} pin must be connected to the supply ground for proper device operation. For enhanced thermal, electrical, and board-level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board, and for proper heat conduction through the board thermal vias need to be incorporated in the PCB in the thermal pad region.

6. System diagram

8-bit I²C-bus and SMBus I/O port with reset

7. Functional description

Refer to Figure 1 "Block diagram of PCA9557".

7.1 Device address

Following a START condition the bus master must output the address of the slave it is accessing. The address of the PCA9557 is shown in <u>Figure 8</u>. To conserve power, no internal pull-up resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

The last bit of the slave address defines the operation to be performed. When set to logic 1 a read is selected, while a logic 0 selects a write operation.

7.2 Control register

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9557, which will be stored in the control register. This register can be written and read via the l^2 C-bus.

Table 4. Register definition

D1	D0	Name	Access	Description
0	0	Register 0	read-only	Input port register
0	1	Register 1	read/write	Output port register
1	0	Register 2	read/write	Polarity inversion register
1	1	Register 3	read/write	Configuration register

7.3 Register descriptions

7.3.1 Register 0 - Input port register

This register is a read-only port. It reflects the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the Configuration register. Writes to this register have no effect.

Table 5.	Register	0 - Input	port register	bit allocation
	<u> </u>			

Bit	7	6	5	4	3	2	1	0
Symbol	17	16	15	14	13	12	l1	10

7.3.2 Register 1 - Output port register

This register reflects the outgoing logic levels of the pins defined as outputs by the Configuration register. Bit values in this register have no effect on pins defined as inputs. In turn, reads from this register reflect the value that is in the flip-flop controlling the output selection, **not** the actual pin value.

Table 6. Register 1 - Output port register bit allocation

	-		_						_
Bit	7	6	5	4	3	2	1	0	
Symbol	07	O6	O5	04	O3	02	O1	O 0	
Default	0	0	0	0	0	0	0	0	

7.3.3 Register 2 - Polarity inversion register

This register enables polarity inversion of pins defined as inputs by the Configuration register. If a bit in this register is set (written with logic 1), the corresponding port pin's polarity is inverted. If a bit in this register is cleared (written with logic 0), the corresponding port pin's original polarity is retained.

Table 7. Register 2 - Polarity inversion register bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	N7	N6	N5	N4	N3	N2	N1	N0
Default	1	1	1	1	0	0	0	0

7.3.4 Register 3 - Configuration register

This register configures the directions of the I/O pins. If a bit in this register is set, the corresponding port pin is enabled as an input with high-impedance output driver. If a bit in this register is cleared, the corresponding port pin is enabled as an output.

Table 8. Register 3 - Configuration register bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	C7	C6	C5	C4	C3	C2	C1	C0
Default	1	1	1	1	1	1	1	1

7.4 Power-on reset

When power is applied to V_{DD}, an internal Power-On Reset (POR) holds the PCA9557 in a reset condition until V_{DD} has reached V_{POR}. At that point, the reset condition is released and the PCA9557 registers and I²C-bus/SMBus state machine will initialize to their default states. Thereafter, V_{DD} must be lowered below 0.2 V to reset the device.

7.5 **RESET** input

A reset can be accomplished by holding the RESET pin LOW for a minimum of $t_{w(rst)}$. The PCA9557 registers and SMBus/I²C-bus state machine will be held in their default state until the RESET input is once again HIGH. This input requires a pull-up resistor to V_{DD} if no active connection is used.

8. Characteristics of the I²C-bus

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

8.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Figure 10).

8.1.1 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P) (see Figure 11.)

8-bit I²C-bus and SMBus I/O port with reset

8.2 System configuration

A device generating a message is a 'transmitter'; a device receiving is the 'receiver'. The device that controls the message is the 'master' and the devices which are controlled by the master are the 'slaves' (see Figure 12).

8.3 Acknowledge

The number of data bytes transferred between the START and the STOP conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter, whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse; set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

8-bit I²C-bus and SMBus I/O port with reset

8.4 Bus transactions

Data is transmitted to the PCA9557 registers using Write Byte transfers (see Figure 14 and Figure 15). Data is read from the PCA9557 registers using Read and Receive Byte transfers (see Figure 16 and Figure 17).

8-bit I²C-bus and SMBus I/O port with reset

Remark: This figure assumes the command byte has previously been programmed with 00h. Transfer of data can be stopped at any moment by a STOP condition. When this occurs, data present at the last acknowledge phase is valid (output mode). Input data is lost.

Fig 17. Read input port register

8-bit I²C-bus and SMBus I/O port with reset

9. Application design-in information

9.1 Minimizing I_{DD} when the I/Os are used to control LEDs

When the I/Os are used to control LEDs, they are normally connected to V_{DD} through a resistor as shown in Figure 18. Since the LED acts as a diode, when the LED is off the I/O V_I is about 1.2 V less than V_{DD}. The supply current, I_{DD}, increases as V_I becomes lower than V_{DD}.

Designs needing to minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to V_{DD} when the LED is off. Figure 19 shows a high value resistor in parallel with the LED. Figure 20 shows V_{DD} less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O V_I at or above V_{DD} and prevents additional supply current consumption when the LED is off.

8-bit I²C-bus and SMBus I/O port with reset

10. Limiting values

Table 9. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage		-0.5	+6	V
VI	input voltage		$V_{SS} - 0.5$	5.5	V
l _l	input current		-	±20	mA
I _{IHL(max)}	maximum allowed input current through protection diode (IO1 to IO7)	$V_{I} \geq V_{DD} \text{ or } V_{I} \leq V_{SS}$	-	±400	μA
V _{I/O}	voltage on an input/output pin	I/O as an input, except IO0	$V_{SS}-0.5$	5.5	V
		IO0 as an input	$V_{SS}-0.5$	5.5	V
I _{I/O}	input/output current	IO0 as an input	-	+400	μΑ
			-	-20	mA
I _{O(IOn)}	output current on pin IOn		-	±50	mA
I _{DD}	supply current		-	85	mA
I _{SS}	ground supply current		-	100	mA
P _{tot}	total power dissipation		-	200	mW
T _{stg}	storage temperature		-65	+150	°C
T _{amb}	ambient temperature	operating	-40	+85	°C

11. Static characteristics

Table 10. Static characteristics

 V_{DD} = 2.3 V to 5.5 V; V_{SS} = 0 V; T_{amb} = -40 °C to +85 °C; unless otherwise specified.

Symbol	Parameter	Conditions		Min	Тур	Max	Unit
Supplies							
V _{DD}	supply voltage			2.3	-	5.5	V
I _{DD}	supply current	operating mode; V _{DD} = 5.5 V; no load; f _{SCL} = 100 kHz		-	19	25	μA
I _{stbL}	LOW-level standby current	standby mode; $V_{DD} = 5.5 V$; no load; $V_I = V_{SS}$; $f_{SCL} = 0 \text{ kHz}$; I/O = inputs		-	0.25	1	μΑ
I _{stbH}	HIGH-level standby current	standby mode; $V_{DD} = 5.5 \text{ V}$; no load; $V_I = V_{DD}$; $f_{SCL} = 0 \text{ kHz}$; I/O = inputs		-	0.25	1	μΑ
ΔI_{stb}	additional standby current	standby mode; $V_{DD} = 5.5 \text{ V}$; every LED I/O at $V_I = 4.3 \text{ V}$; $f_{SCL} = 0 \text{ kHz}$		-	0.8	1	mA
V _{POR}	power-on reset voltage	no load; $V_I = V_{DD}$ or V_{SS}	<u>[1]</u>	-	1.65	2.1	V
Input SCL;	input/output SDA						
V _{IL}	LOW-level input voltage			-0.5	-	$+0.3V_{DD}$	V
V _{IH}	HIGH-level input voltage			$0.7V_{DD}$	-	5.5	V

۱L	leakage current	$V_{I} = V_{DD} \text{ or } V_{SS}$		-1	-	+1	μA
Ci	input capacitance	$V_{I} = V_{SS}$		-	6	10	pF
I/Os							
V _{IL}	LOW-level input voltage			-0.5	-	+0.8	V
V _{IH}	HIGH-level input voltage			2.0	-	5.5	V
I _{OL}	LOW-level output current		[2]	8	10	-	mA
I _{OH}	HIGH-level output current	except pin IO0; V_{OH} = 2.4 V	[3]	4	-	-	mA
		pin IO0; V _{OH} = 4.6 V		-	-	1	μA
		pin IO0; V _{OH} = 3.3 V		-	-	1	μΑ
ILI	input leakage current	$V_{DD} = 5.5 \text{ V}; \text{ V}_{I} = V_{SS}$		-	-	-100	μΑ
Ci	input capacitance			-	3.7	5	pF
Co	output capacitance			-	3.7	5	pF
Select inpu	Its A0, A1, A2 and RESET						
V _{IL}	LOW-level input voltage			-0.5	-	+0.8	V
VIH	HIGH-level input voltage			2.0	-	5.5	V
ILI	input leakage current			-1	-	+1	μA

[1] V_{DD} must be lowered to 0.2 V in order to reset part.

[2] The total amount sunk by all I/Os must be limited to 100 mA and 25 mA per bit.

[3] The total current sourced by all I/Os must be limited to 85 mA and 20 mA per bit.

12. Dynamic characteristics

Table 11.	Dynamic characteristics							
Symbol	Parameter	Conditions		Standard-mode I ² C-bus		Fast-mode I ² C-bus		Unit
				Min	Max	Min	Max	
f _{SCL}	SCL clock frequency			0	100	0	400	kHz
t _{BUF}	bus free time between a STOP and START condition			4.7	-	1.3	-	μs
t _{HD;STA}	hold time (repeated) START condition			4.0	-	0.6	-	μs
t _{SU;STA}	set-up time for a repeated START condition			4.7	-	0.6	-	μs
t _{SU;STO}	set-up time for STOP condition			4.0	-	0.6	-	μs
t _{HD;DAT}	data hold time			0	-	0	-	ns
t _{VD;ACK}	data valid acknowledge time		[1]	-	1	-	0.9	μs
t _{VD;DAT}	data valid time		[2]	-	1	-	0.9	μs
t _{SU;DAT}	data set-up time			250	-	100	-	ns
t _{LOW}	LOW period of the SCL clock			4.7	-	1.3	-	μs
t _{HIGH}	HIGH period of the SCL clock			4.0	-	0.6	-	μs
t _f	fall time of both SDA and SCL signals			-	300	20 + 0.1C _b [3]	300	ns
t _r	rise time of both SDA and SCL signals			-	1000	20 + 0.1C _b [3]	300	ns
t _{SP}	pulse width of spikes that must be suppressed by the input filter			-	50	-	50	ns
Port timir	ng							
t _{v(Q)}	data output valid time	pin IO0		-	250	-	250	ns
		pins IO1 to IO7		-	200	-	200	ns
t _{su(D)}	data input set-up time			0	-	0	-	ns
t _{h(D)}	data input hold time			200	-	200	-	ns
Reset tim	ling							
t _{w(rst)}	reset pulse width			4	-	4	-	ns
t _{rec(rst)}	reset recovery time			0	-	0	-	ns
t _{rst}	reset time			400	-	400	-	ns

[1] $t_{VD;ACK}$ = time for acknowledgement signal from SCL LOW to SDA (out) LOW.

[2] $t_{VD;DAT}$ = minimum time for SDA data out to be valid following SCL LOW.

[3] C_b = total capacitance of one bus line in pF.

14. Handling information

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be completely safe you must take normal precautions appropriate to handling integrated circuits.

15. Soldering

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

15.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

15.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- · Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus PbSn soldering

15.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

15.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 26</u>) than a PbSn process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 12 and 13

Table 12. SnPb eutectic process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)			
	Volume (mm ³)			
	< 350	≥ 350		
< 2.5	235	220		
≥ 2.5	220	220		

Table 13. Lead-free process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)				
	Volume (mm ³)				
	< 350	350 to 2000	> 2000		
< 1.6	260	260	260		
1.6 to 2.5	260	250	245		
> 2.5	250	245	245		

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 26.

18. Legal information

18.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

18.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

18.3 Disclaimers

General — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of a NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
