●Application example

●Operation notes

- (1) When the MUTE pin voltage reaches 1.5V or higher, the output voltage is muted and the bias level is output.
- (2) Frequency characteristics can be changed by adjusting the capacitor attached to pin 3 (pin18) or pin 5 (pin16).
- (3) Gain can be changed by attaching a resistor to pin 4 (pin17).
- (4) To prevent popping sounds due to sudden fluctuation in the mute pin voltage, attach a capacitor (approximately 1 μ F) to pin 7.
- (5) Be sure to connect the IC to a 0.1 μ F bypass capacitor to the power supply, at the base of the IC.
