

SUMMARY

Note: This datasheet is preliminary. This document contains material that is subject to change without notice.

High performance 32-bit/40-bit floating point processor optimized for high performance audio processing

Single-instruction, multiple-data (SIMD) computational architecture

On-chip memory—5 Mbits of on-chip RAM, 4 Mbits of on-chip ROM

400 MHz operating frequency

Qualified for Automotive Applications. See [Automotive Products on Page 64](#)

Code compatible with all other members of the SHARC family
The ADSP-2148x processors are available with unique audio-centric peripherals such as the digital applications interface, serial ports, precision clock generators, S/PDIF transceiver, asynchronous sample rate converters, input data port, and more.

For complete ordering information see [Ordering Guide on Page 65](#).

REVISION HISTORY

3/10 Rev PrA: Initial Version

GENERAL DESCRIPTION

The ADSP-2148x SHARC[®] processors are members of the SIMD SHARC family of DSPs that feature Analog Devices' Super Harvard Architecture. The processors are source code compatible with the ADSP-2126x, ADSP-2136x, ADSP-2137x, ADSP-2146x, and ADSP-2116x DSPs as well as with first generation ADSP-2106x SHARC processors in SISD (single-instruction, single-data) mode. These new processors are 32-bit/40-bit floating point processors optimized for high performance audio applications with its large on-chip SRAM, multiple internal buses to eliminate I/O bottlenecks, and an innovative digital applications interface (DAI).

Table 1 shows performance benchmarks for the ADSP-2148x processors. Table 2 shows the features of the individual product offerings.

Table 1. Processor Benchmarks

Benchmark Algorithm	Speed (at 400 MHz)
1024 Point Complex FFT (Radix 4, With Reversal)	23 μ s
FIR Filter (per Tap) ¹	1.25 ns
IIR Filter (per Biquad) ¹	5 ns
Matrix Multiply (Pipelined)	
[3 \times 3] \times [3 \times 1]	11.25 ns
[4 \times 4] \times [4 \times 1]	20 ns
Divide (y/x)	7.5 ns
Inverse Square Root	11.25 ns

¹ Assumes two files in multichannel SIMD mode

¹ Audio decoding algorithms include Dolby AC-3 DTS 5.1, and Nueral Surround Decoder, MPEG-2 and AAC. Decoder/post-processor algorithm combination support varies depending upon the chip version and the system configurations. Please visit www.analog.com for complete information.

² These products contain the Digital Transmission Content Protection protocol, a proprietary security protocol. Contact your Analog Devices sales office for more information.

³ The 100-lead packages of the ADSP-21483/21486/21488/ADSP-21489 processors do not contain an external port. And the ADSP-21486 processor in the 176-lead package does not contain a SDRAM controller.

The diagram on [Page 1](#) shows the two clock domains that make up the ADSP-2148x processors. The core clock domain contains the following features.

- Two processing elements (PE_x, PE_y), each of which comprises an ALU, multiplier, shifter, and data register file
- Data address generators (DAG1, DAG2)
- Program sequencer with instruction cache
- PM and DM buses capable of supporting 2x64-bit data transfers between memory and the core at every core processor cycle
- One periodic interval timer with pinout
- On-chip SRAM (5M bit)
- On-chip mask-programmable ROM (4M bit)
- JTAG test access port for emulation and boundary scan. The JTAG provides software debug through user breakpoints which allows flexible exception handling.

The block diagram of the ADSP-2148x on [Page 1](#) also shows the peripheral clock domain (also known as the I/O processor) which contains the following features:

- IOD0 (peripheral DMA) and IOD1 (external port DMA) buses for 32-bit data transfers
- Peripheral and external port buses for core connection
- External port with an AMI and SDRAM controller
- 4 units for PWM control
- 1 MTM unit for internal-to-internal memory transfers
- Digital applications interface that includes four precision clock generators (PCG), a input data port (IDP/PDAP) for serial and parallel interconnect, an S/PDIF receiver/transmitter, four asynchronous sample rate converters, eight serial ports, a flexible signal routing unit (DAI SRU).
- Digital peripheral interface that includes two timers, a 2-wire interface, one UART, two serial peripheral interfaces (SPI), 2 precision clock generators (PCG), pulse width modulation (PWM), and a flexible signal routing unit (DPI SRU).

As shown in the functional block diagram on [Page 5](#), the processor uses two computational units to deliver a significant performance increase over the previous SHARC processors on a range of DSP algorithms. With its SIMD computational hardware, the processors can perform 2.4 GFLOPS running at 400 MHz.

FAMILY CORE ARCHITECTURE

The ADSP-2148x is code compatible at the assembly level with the ADSP-2146x, ADSP-2137x, ADSP-2136x, ADSP-2126x, ADSP-21160, and ADSP-21161, and with the first generation ADSP-2106x SHARC processors. The ADSP-2148x shares architectural features with the ADSP-2126x, ADSP-2136x, ADSP-2137x, ADSP-2146x and ADSP-2116x SIMD SHARC processors, as shown in [Figure 2](#) and detailed in the following sections.

SIMD Computational Engine

The ADSP-2148x contains two computational processing elements that operate as a single-instruction, multiple-data (SIMD) engine. The processing elements are referred to as PEX and PEY and each contains an ALU, multiplier, shifter, and register file. PEX is always active, and PEY may be enabled by setting the PEYEN mode bit in the MODE1 register. When this mode is enabled, the same instruction is executed in both processing elements, but each processing element operates on different data. This architecture is efficient at executing math intensive DSP algorithms.

Entering SIMD mode also has an effect on the way data is transferred between memory and the processing elements. When in SIMD mode, twice the data bandwidth is required to sustain computational operation in the processing elements. Because of this requirement, entering SIMD mode also doubles the bandwidth between memory and the processing elements. When using the DAGs to transfer data in SIMD mode, two data values are transferred with each access of memory or the register file.

Independent, Parallel Computation Units

Within each processing element is a set of computational units. The computational units consist of an arithmetic/logic unit (ALU), multiplier, and shifter. These units perform all operations in a single cycle. The three units within each processing element are arranged in parallel, maximizing computational throughput. Single multifunction instructions execute parallel ALU and multiplier operations. In SIMD mode, the parallel ALU and multiplier operations occur in both processing elements. These computation units support IEEE 32-bit single-precision floating-point, 40-bit extended precision floating-point, and 32-bit fixed-point data formats.

Timer

The processor contains a core timer that can generate periodic software interrupts. The core timer can be configured to use FLAG3 as a timer expired signal.

Data Register File

A general-purpose data register file is contained in each processing element. The register files transfer data between the computation units and the data buses, and store intermediate results. These 10-port, 32-register (16 primary, 16 secondary) register files, combined with the processor's enhanced Harvard architecture, allow unconstrained data flow between computation units and internal memory. The registers in PEX are referred to as R0-R15 and in PEY as S0-S15.

Context Switch

Many of the processor's registers have secondary registers that can be activated during interrupt servicing for a fast context switch. The data registers in the register file, the DAG registers, and the multiplier result registers all have secondary registers. The primary registers are active at reset, while the secondary registers are activated by control bits in a mode control register.

Universal Registers

These registers can be used for general-purpose tasks. The USTAT (4) registers allow easy bit manipulations (Set, Clear, Toggle, Test, XOR) for all core system registers (control/status).

The data bus exchange register (PX) permits data to be passed between the 64-bit PM data bus and the 64-bit DM data bus, or between the 40-bit register file and the PM data bus. These registers contain hardware to handle the data width difference.

Figure 2. SHARC Core Block Diagram

Single-Cycle Fetch of Instruction and Four Operands

The ADSP-2148x features an enhanced Harvard architecture in which the data memory (DM) bus transfers data and the program memory (PM) bus transfers both instructions and data (see Figure 2). With its separate program and data memory buses and on-chip instruction cache, the processor can simultaneously fetch four operands (two over each data bus) and one instruction (from the cache), all in a single cycle.

Instruction Cache

The processor includes an on-chip instruction cache that enables three-bus operation for fetching an instruction and four data values. The cache is selective—only the instructions whose fetches conflict with PM bus data accesses are cached. This cache allows full speed execution of core, looped operations such as digital filter multiply-accumulates, and FFT butterfly processing.

Data Address Generators With Zero-Overhead Hardware Circular Buffer Support

The ADSP-2148x’s two data address generators (DAGs) are used for indirect addressing and implementing circular data buffers in hardware. Circular buffers allow efficient programming of delay lines and other data structures required in digital signal processing, and are commonly used in digital filters and Fourier transforms. The two DAGs of the processors contain sufficient registers to allow the creation of up to 32 circular buffers (16 primary register sets, 16 secondary). The DAGs automatically handle address pointer wraparound, reduce overhead, increase performance, and simplify implementation. Circular buffers can start and end at any memory location.

Flexible Instruction Set

The 48-bit instruction word accommodates a variety of parallel operations, for concise programming. For example, the ADSP-2148x can conditionally execute a multiply, an add, and a subtract in both processing elements while branching and fetching up to four 32-bit values from memory, all in a single instruction.

Variable Instruction Set Architecture (VISA)

In addition to supporting the standard 48-bit instructions from previous SHARC processors, the ADSP-2148x supports new instructions of 16 and 32 bits. This feature, called Variable Instruction Set Architecture (VISA), drops redundant/unused bits within the 48-bit instruction to create more efficient and compact code. The program sequencer supports fetching these 16-bit and 32-bit instructions from both internal and external SDRAM memory. This support is not extended to the asynchronous memory interface (AMI). Source modules need to be built using the VISA option, in order to allow code generation tools to create these more efficient opcodes.

On-Chip Memory

The ADSP-21483 and the ADSP-21488 processors contain 3 Mbits of internal RAM (Table 3) and the ADSP-21486, ADSP-21487, and ADSP-21489 processors contain 5 Mbits of internal RAM (Table 4). Each memory block supports single-cycle, independent accesses by the core processor and I/O pro-

ROM Based Security

The ADSP-2148x has a ROM security feature that provides hardware support for securing user software code by preventing unauthorized reading from the internal code when enabled. When using this feature, the processor does not boot-load any external code, executing exclusively from internal ROM. Additionally, the processor is not freely accessible via the JTAG port. Instead, a unique 64-bit key, which must be scanned in through the JTAG or Test Access Port will be assigned to each customer. The device will ignore a wrong key. Emulation features and external boot modes are only available after the correct key is scanned.

Digital Transmission Content Protection

The DTCP specification defines a cryptographic protocol for protecting audio entertainment content from illegal copying, intercepting, and tampering as it traverses high performance digital buses, such as the IEEE 1394 standard. Only legitimate entertainment content delivered to a source device via another approved copy protection system (such as the DVD content scrambling system) is protected by this copy protection system. For more information on this feature, contact your local ADI sales office.

On-Chip Memory Bandwidth

The internal memory architecture allows programs to have four accesses at the same time to any of the four blocks (assuming there are no block conflicts). The total bandwidth is realized using the DMD and PMD buses (2 x 64-bits, CCLK speed) and the IOD0/1 buses (2 x 32-bit, PCLK speed).

cessor. The ADSP-2148x memory architecture, in combination with its separate on-chip buses, allow two data transfers from the core and one from the I/O processor, in a single cycle.

The processor's SRAM can be configured as a maximum of 160k words of 32-bit data, 320k words of 16-bit data, 106.7k words of 48-bit instructions (or 40-bit data), or combinations of different word sizes up to 5 megabits. All of the memory can be accessed as 16-bit, 32-bit, 48-bit, or 64-bit words. A 16-bit floating-point storage format is supported that effectively doubles the amount of data that may be stored on-chip. Conversion between the 32-bit floating-point and 16-bit floating-point formats is performed in a single instruction. While each memory block can store combinations of code and data, accesses are most efficient when one block stores data using the DM bus for transfers, and the other block stores instructions and data using the PM bus for transfers.

Using the DM bus and PM buses, with one bus dedicated to a memory block, assures single-cycle execution with two data transfers. In this case, the instruction must be available in the cache.

The memory maps in Table 3 and Table 4 on Page 8 displays the internal memory address space of the processors. The 48-bit space section describes what this address range looks like to an instruction that retrieves 48-bit memory. The 32-bit section describes what this address range looks like to an instruction that retrieves 32-bit memory.

FAMILY PERIPHERAL ARCHITECTURE

The ADSP-2148x family contains a rich set of peripherals that support a wide variety of applications including high quality audio, medical imaging, communications, military, test equipment, 3D graphics, speech recognition, motor control, imaging, and other applications.

External Port

The external port is available in the 176-lead LQFP package. The external port interface supports access to the external memory through core and DMA accesses. The external memory address space is divided into four banks. Any bank can be programmed as either asynchronous or synchronous memory. The external ports are comprised of the following modules.

- An Asynchronous Memory Interface which communicates with SRAM, FLASH, and other devices that meet the standard asynchronous SRAM access protocol. The AMI supports 14M words of external memory in bank 0 and 16M words of external memory in bank 1, bank 2, and bank 3.
- An SDRAM controller that supports a glueless interface with any of the standard SDRAMs. The SDC supports 62M words of external memory in bank 0, and 64M words of external memory in bank 1, bank 2, and bank 3.
- Arbitration logic to coordinate core and DMA transfers between internal and external memory over the external port.

External Memory

The external port provides a high performance, glueless interface to a wide variety of industry-standard memory devices. The external port, available on the 176-lead LQFP, may be used to interface to synchronous and/or asynchronous memory devices through the use of its separate internal memory controllers. The first is an SDRAM controller for connection of industry-standard synchronous DRAM devices and DIMMs (dual inline memory module), while the second is an asynchronous memory controller intended to interface to a variety of memory devices. Four memory select pins enable up to four separate devices to coexist, supporting any desired combination of synchronous and asynchronous device types. Non-SDRAM external memory address space is shown in [Table 5](#).

Table 5. External Memory for Non-SDRAM Addresses

Bank	Size in Words	Address Range
Bank 0	14M	0x0020 0000–0x00FF FFFF
Bank 1	16M	0x0400 0000–0x04FF FFFF
Bank 2	16M	0x0800 0000–0x08FF FFFF
Bank 3	16M	0x0C00 0000–0x0CFF FFFF

SIMD Access to External Memory

The SDRAM controller on the processor supports SIMD access on the 64-bit EPD (external port data bus) which allows to access the complementary registers on the PEy unit in the normal word space (NW). This improves performance since there is no need to explicitly load the complimentary registers as in SISR mode.

External Memory Execution

In the ADSP-21486, ADSP-21487, and ADSP-21489, the program sequencer can execute code directly from external memory bank 0 (SRAM, SDRAM). This allows a reduction in internal memory size. With external execution, programs run at slower speeds since 48-bit instructions are fetched in parts from a 16-bit external bus coupled with the inherent latency of fetching instructions from SDRAM. Fetching instructions from SDRAM generally takes 1.5 peripheral clock cycles per instruction.

VISA and Non VISA Access to External Memory

The SDRAM controller on the processor supports VISA code operation which reduces the memory load since the VISA instructions are compressed. Moreover, bus fetching is reduced because in the best case one 48-bit fetch contains 3 valid

instructions. Code execution from the traditional non-VISA operation is also supported. Note that code execution is only supported from bank 0 regardless of VISA/non-VISA.

SDRAM Controller

The SDRAM controller provides an interface of up to four separate banks of industry-standard SDRAM devices or DIMMs, at speeds up to f_{SDCLK} . Fully compliant with the SDRAM standard, each bank has its own memory select line ($MS0$ – $MS3$), and can be configured to contain between 16M bytes and 128M bytes of memory. SDRAM external memory address space is shown in [Table 6](#).

Table 6. External Memory for SDRAM Addresses

Bank	Size in Words	Address Range
Bank 0	62M	0x0020 0000–0x03FF FFFF
Bank 1	64M	0x0400 0000–0x07FF FFFF
Bank 2	64M	0x0800 0000–0x0BFF FFFF
Bank 3	64M	0x0C00 0000–0x0FFF FFFF

A set of programmable timing parameters is available to configure the SDRAM banks to support slower memory devices. Note that 32-bit wide devices are not supported on SDRAM and the AMI interface.

The SDRAM controller address, data, clock, and control pins can drive loads up to distributed 30 pF loads. For larger memory systems, the SDRAM controller external buffer timing should be selected and external buffering should be provided so that the load on the SDRAM controller pins does not exceed 30 pF.

Note that the external memory bank addresses shown are for normal-word (32-bit) accesses. If 48-bit instructions as well as 32-bit data are both placed in the same external memory bank, care must be taken while mapping them to avoid overlap. In case of 16-bit wide external memory, two 48-bit instructions are stored in six 32-bit wide memory locations. For example, if 2k instructions are placed in 16-bit wide external memory starting at the bank 0 normal-word base address 0x0030 0000 (corresponding to instruction address 0x0020 0000) and ending at address 0x0030 0BFF (corresponding to instruction address 0x0020 07FF), then data buffers can be placed starting at an address that is offset by 3k 32-bit words (for example, starting at 0x0030 0C00).

Asynchronous Memory Controller

The asynchronous memory controller provides a configurable interface for up to four separate banks of memory or I/O devices. Each bank can be independently programmed with different timing parameters, enabling connection to a wide variety of memory devices including SRAM, flash, and EPROM, as well as I/O devices that interface with standard memory control lines. Bank 0 occupies a 14M word window and banks 1, 2, and 3 occupy a 16M word window in the processor’s address space but, if not fully populated, these windows are not made contiguous by the memory controller logic.

External Port Throughput

The throughput for the external port, based on 166 MHz clock and 16-bit data bus, is 111 M bytes/s for the AMI and 333 M bytes/s for SDRAM.

MediaLB

The automotive models of the ADSP-2148x processors have an MLB interface which allows the processor to function as a media local bus device. It includes support for both 3-pin as well as 5-pin media local bus protocols. It supports speeds up to 1024 FS (49.25 Mbits/sec, FS = 48.1 kHz) and up to 31 logical channels, with up to 124 bytes of data per media local bus frame. For a list of automotive products, see [Automotive Products on Page 64](#).

Pulse-Width Modulation

The PWM module is a flexible, programmable, PWM waveform generator that can be programmed to generate the required switching patterns for various applications related to motor and engine control or audio power control. The PWM generator can generate either center-aligned or edge-aligned PWM waveforms. In addition, it can generate complementary signals on two outputs in paired mode or independent signals in non-paired mode (applicable to a single group of four PWM waveforms).

The entire PWM module has four groups of four PWM outputs each. Therefore, this module generates 16 PWM outputs in total. Each PWM group produces two pairs of PWM signals on the four PWM outputs.

The PWM generator is capable of operating in two distinct modes while generating center-aligned PWM waveforms: single-update mode or double-update mode. In single-update mode the duty cycle values are programmable only once per PWM period. This results in PWM patterns that are symmetrical about the mid-point of the PWM period. In double-update mode, a second updating of the PWM registers is implemented at the mid-point of the PWM period. In this mode, it is possible to produce asymmetrical PWM patterns that produce lower harmonic distortion in three-phase PWM inverters.

PWM signals can be mapped to the external port address lines or to the DPI pins.

Digital Applications Interface (DAI)

The digital applications interface (DAI) provides the ability to connect various peripherals to any of the DAI pins (DAI_P20–1).

Programs make these connections using the signal routing unit (SRU), shown in [Figure 1](#).

The SRU is a matrix routing unit (or group of multiplexers) that enables the peripherals provided by the DAI to be interconnected under software control. This allows easy use of the DAI associated peripherals for a much wider variety of applications by using a larger set of algorithms than is possible with nonconfigurable signal paths.

The DAI also includes eight serial ports, four precision clock generators (PCG), a S/PDIF transceiver, four ASRCs, and an input data port (IDP). The IDP provides an additional input path to the SHARC core, configurable as either eight channels of serial data, or a single 20-bit wide synchronous parallel data acquisition port. Each data channel has its own DMA channel that is independent from the processor's serial ports.

Serial Ports

The ADSP-2148x features eight synchronous serial ports that provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices' AD183x family of audio codecs, ADCs, and DACs. The serial ports are made up of two data lines, a clock, and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

Serial ports can support up to 16 transmit or 16 receive channels of audio data when all eight SPORTs are enabled, or four full duplex TDM streams of 128 channels per frame.

The serial ports operate at a maximum data rate of $f_{PCLK}/4$. Serial port data can be automatically transferred to and from on-chip memory/external memory via dedicated DMA channels. Each of the serial ports can work in conjunction with another serial port to provide TDM support. One SPORT provides two transmit signals while the other SPORT provides the two receive signals. The frame sync and clock are shared.

Serial ports operate in five modes:

- Standard serial mode
- Multichannel (TDM) mode
- I²S mode
- Packed I²S mode
- Left-justified mode

Left-justified mode is a mode where in each frame sync cycle two samples of data are transmitted/received—one sample on the high segment of the frame sync, the other on the low segment of the frame sync. Programs have control over various attributes of this mode.

Each of the serial ports supports the left-justified and I²S protocols (I²S is an industry-standard interface commonly used by audio codecs, ADCs, and DACs such as the Analog Devices AD183x family), with two data pins, allowing four left-justified or I²S channels (using two stereo devices) per serial port, with a maximum of up to 32 I²S channels. The serial ports permit little-endian or big-endian transmission formats and word lengths selectable from 3 bits to 32 bits. For the left-justified and I²S modes, data-word lengths are selectable between 8 bits and 32 bits. Serial ports offer selectable synchronization and transmit modes as well as optional μ -law or A-law companding selection on a per channel basis. Serial port clocks and frame syncs can be internally or externally generated.

The serial ports also contain frame sync error detection logic where the serial ports detect frame syncs that arrive early (for example frame syncs that arrive while the transmission/reception of the previous word is occurring). All the serial ports also share one dedicated error interrupt.

S/PDIF-Compatible Digital Audio Receiver/Transmitter

The S/PDIF receiver/transmitter has no separate DMA channels. It receives audio data in serial format and converts it into a biphasic encoded signal. The serial data input to the receiver/transmitter can be formatted as left justified, I²S or right-justified with word widths of 16, 18, 20, or 24 bits.

The serial data, clock, and frame sync inputs to the S/PDIF receiver/transmitter are routed through the signal routing unit (SRU). They can come from a variety of sources such as the SPORTs, external pins, the precision clock generators (PCGs), and are controlled by the SRU control registers.

Asynchronous Sample Rate Converter

The sample rate converter (ASRC) contains four ASRC blocks and is the same core as that used in the AD1896 192 kHz stereo asynchronous sample rate converter and provides up to 128 dB SNR. The ASRC block is used to perform synchronous or asynchronous sample rate conversion across independent stereo channels, without using internal processor resources. The four SRC blocks can also be configured to operate together to convert multichannel audio data without phase mismatches. Finally, the ASRC can be used to clean up audio data from jittery clock sources such as the S/PDIF receiver.

Input Data Port

The IDP provides up to eight serial input channels—each with its own clock, frame sync, and data inputs. The eight channels are automatically multiplexed into a single 32-bit by eight-deep FIFO. Data is always formatted as a 64-bit frame and divided into two 32-bit words. The serial protocol is designed to receive audio channels in I²S, left-justified sample pair, or right-justified mode. One frame sync cycle indicates one 64-bit left/right pair, but data is sent to the FIFO as 32-bit words (that is, one-half of a frame at a time). The processor supports 24- and 32-bit I²S, 24- and 32-bit left-justified, and 24-, 20-, 18- and 16-bit right-justified formats.

Precision Clock Generators

The precision clock generators (PCG) consist of four units, each of which generates a pair of signals (clock and frame sync) derived from a clock input signal. The units, A, B, C, and D, are identical in functionality and operate independently of each other. The two signals generated by each unit are normally used as a serial bit clock/frame sync pair.

The outputs of PCG A and B can be routed through the DAI pins and the outputs of PCG C and D can be driven on to the DAI as well as the DPI pins.

Digital Peripheral Interface (DPI)

The digital peripheral interface provides connections to two serial peripheral interface ports (SPI), one universal asynchronous receiver-transmitter (UART), 12 flags, a 2-wire interface (TWI), three PWM modules (PWM3-1), and two general-purpose timers.

Serial Peripheral (Compatible) Interface

The ADSP-2148x SHARC processors contain two serial peripheral interface ports (SPIs). The SPI is an industry-standard synchronous serial link, enabling the SPI-compatible port to communicate with other SPI compatible devices. The SPI consists of two data pins, one device select pin, and one clock pin. It is a full-duplex synchronous serial interface, supporting both master and slave modes. The SPI port can operate in a multi-master environment by interfacing with up to four other SPI-compatible devices, either acting as a master or slave device. The SPI-compatible peripheral implementation also features programmable baud rate and clock phase and polarities. The SPI-compatible port uses open drain drivers to support a multimaster configuration and to avoid data contention.

UART Port

The processors provide a full-duplex Universal Asynchronous Receiver/Transmitter (UART) port, which is fully compatible with PC-standard UARTs. The UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. The UART also has multiprocessor communication capability using 9-bit address detection. This allows it to be used in multidrop networks through the RS-485 data interface standard. The UART port also includes support for 5 to 8 data bits, 1 or 2 stop bits, and none, even, or odd parity. The UART port supports two modes of operation:

- PIO (programmed I/O) – The processor sends or receives data by writing or reading I/O-mapped UART registers. The data is double-buffered on both transmit and receive.
- DMA (direct memory access) – The DMA controller transfers both transmit and receive data. This reduces the number and frequency of interrupts required to transfer data to and from memory. The UART has two dedicated DMA channels, one for transmit and one for receive. These DMA channels have lower default priority than most DMA channels because of their relatively low service rates.

The UART port’s baud rate, serial data format, error code generation and status, and interrupts are programmable:

- Support for bit rates ranging from ($f_{CLK}/1,048,576$) to ($f_{CLK}/16$) bits per second.
- Support for data formats from 7 to 12 bits per frame.
- Both transmit and receive operations can be configured to generate maskable interrupts to the processor.

In conjunction with the general-purpose timer functions, auto-baud detection is supported.

Timers

The ADSP-2148x has a total of three timers: a core timer that can generate periodic software interrupts and two general-purpose timers that can generate periodic interrupts and be independently set to operate in one of three modes:

- Pulse waveform generation mode
- Pulse width count/capture mode
- External event watch dog mode

The core timer can be configured to use FLAG3 as a timer expired signal, and the general-purpose timers have one bidirectional pin and four registers that implement its mode of operation: a 6-bit configuration register, a 32-bit count register, a 32-bit period register, and a 32-bit pulse width register. A single control and status register enables or disables the general-purpose timer.

2-Wire Interface Port (TWI)

The TWI is a bidirectional 2-wire, serial bus used to move 8-bit data while maintaining compliance with the I²C bus protocol. The TWI master incorporates the following features:

- 7-bit addressing
- Simultaneous master and slave operation on multiple device systems with support for multi master data arbitration
- Digital filtering and timed event processing
- 100 kbps and 400 kbps data rates
- Low interrupt rate

I/O PROCESSOR FEATURES

The I/O processors provide up to 63 channels of DMA as well as an extensive set of peripherals.

DMA Controller

The processor’s on-chip DMA controller allows data transfers without processor intervention. The DMA controller operates independently and invisibly to the processor core, allowing DMA operations to occur while the core is simultaneously executing its program instructions. DMA transfers can occur between the ADSP-2148x’s internal memory and its serial ports, the SPI-compatible (serial peripheral interface) ports, the IDP (input data port), the parallel data acquisition port (PDAP) or the UART. The DMA channel summary is shown in [Table 7](#).

Programs can be downloaded to the ADSP-2148x using DMA transfers. Other DMA features include interrupt generation upon completion of DMA transfers, and DMA chaining for automatic linked DMA transfers.

Table 7. DMA Channels

Peripheral	DMA Channels
SPORTs	16
PDAP	8
SPI	2
UART	2
External Port	2
Accelerators	2
Memory-to-Memory	2
MLB ¹	31

¹ Automotive models only.

Delay Line DMA

The ADSP-2148x processor provides delay line DMA functionality. This allows processor reads and writes to external delay line buffers (and hence to external memory) with limited core interaction.

Scatter/Gather DMA

The ADSP-2148x processor provides scatter/gather DMA functionality. This allows processor DMA reads/writes to/from non-contiguous memory blocks.

FFT Accelerator

FFT accelerator implements radix-2 complex/real input, complex output FFT with no core intervention.

FIR Accelerator

The FIR (finite impulse response) accelerator consists of a 1024 word coefficient memory, a 1024 word deep delay line for the data, and four MAC units. A controller manages the accelerator. The FIR accelerator runs at the peripheral clock frequency.

IIR Accelerator

The IIR (infinite impulse response) accelerator consists of a 1440 word coefficient memory for storage of biquad coefficients, a data memory for storing the intermediate data and one MAC unit. A controller manages the accelerator. The IIR accelerator runs at the peripheral clock frequency.

Watch Dog Timer

The watch dog timer is used to supervise the stability of the system software. When used in this way, software reloads the watch dog timer in a regular manner so that the downward counting timer never expires. An expiring timer then indicates that system software might be out of control.

The ADSP-2148x processors include a 32-bit watch dog timer that can be used to implement a software watch dog function. A software watch dog can improve system reliability by forcing the processor to a known state through generation of a system reset, if the timer expires before being reloaded by software. Software initializes the count value of the timer, and then enables the timer.

The watch dog timer resets both the core and the internal peripherals. After an external reset, the WDT must be disabled by default. Software must be able to determine if the watch dog was the source of the hardware reset by interrogating a status bit in the watch dog timer control register.

The WDT contains a software programmable Trip Counter register that sets the number of times that the WDT can expire before the $\overline{\text{WDTRSTO}}$ pin is continually asserted until the next time hardware reset is applied. The trip counter is not cleared by the WDT generated reset. This gives software the ability to count the number of WDT generated resets using the CUR-TRIPVAL field in the trip counter register.

SYSTEM DESIGN

The following sections provide an introduction to system design options and power supply issues.

Program Booting

The internal memory of the ADSP-2148x boots at system power-up from an 8-bit EPROM via the external port, an SPI master, or an SPI slave. Booting is determined by the boot configuration (BOOT_CFG2-0) pins in [Table 8](#).

Table 8. Boot Mode Selection

BOOT_CFG2-0 ¹	Booting Mode
000	SPI Slave Boot
001	SPI Master Boot
010	AMI User Boot (for 8-bit Flash Boot)
011	No boot (processor executes from internal ROM after reset)
1xx	Reserved

¹The BOOT_CFG2 pin is not available on the 100-pin package.

The “Running Reset” feature allows a user to perform a reset of the processor core and peripherals, but without resetting the PLL and SDRAM controller, or performing a boot. The functionality of the RESETOUT/RUNRSTIN pin has now been extended to also act as the input for initiating a Running Reset. For more information, see the ADSP-214xx SHARC Processor Hardware Reference.

Power Supplies

The processors have separate power supply connections for the internal (V_{DD_INT}) and external (V_{DD_EXT}), power supplies. The internal and analog supplies must meet the V_{DD_INT} specifications. The external supply must meet the V_{DD_EXT} specification. All external supply pins must be connected to the same power supply.

To reduce noise coupling, the PCB should use a parallel pair of power and ground planes for V_{DD_INT} and GND.

Target Board JTAG Emulator Connector

Analog Devices DSP Tools product line of JTAG emulators uses the IEEE 1149.1 JTAG test access port of the ADSP-2148x processors to monitor and control the target board processor during emulation. Analog Devices DSP Tools product line of JTAG emulators provides emulation at full processor speed, allowing inspection and modification of memory, registers, and processor stacks. The processor's JTAG interface ensures that the emulator will not affect target system loading or timing.

For complete information on Analog Devices' SHARC DSP Tools product line of JTAG emulator operation, see the appropriate “Emulator Hardware User's Guide”.

DEVELOPMENT TOOLS

The ADSP-2148x processors are supported with a complete set of CROSSCORE[®] software and hardware development tools, including Analog Devices emulators and VisualDSP++[®] development environment. The same emulator hardware that supports other SHARC processors also fully emulates the ADSP-2148x processors.

EZ-KIT Lite Evaluation Board

For evaluation of the processors, use the EZ-KIT Lite[®] board being developed by Analog Devices. The board comes with on-chip emulation capabilities and is equipped to enable software development. Multiple daughter cards are available.

Designing an Emulator-Compatible DSP Board (Target)

The Analog Devices family of emulators are tools that every DSP developer needs to test and debug hardware and software systems. Analog Devices has supplied an IEEE 1149.1 JTAG Test Access Port (TAP) on each JTAG DSP. Nonintrusive in-circuit emulation is assured by the use of the processor's JTAG interface—the emulator does not affect target system loading or timing. The emulator uses the TAP to access the internal features of the processor, allowing the developer to load code, set breakpoints, observe variables, observe memory, and examine registers. The processor must be halted to send data and commands, but once an operation has been completed by the emulator, the DSP system is set running at full speed with no impact on system timing.

To use these emulators, the target board must include a header that connects the DSP's JTAG port to the emulator.

For details on target board design issues including mechanical layout, single processor connections, signal buffering, signal termination, and emulator pod logic, see the *EE-68: Analog Devices JTAG Emulation Technical Reference* on the Analog Devices website (www.analog.com)—use site search on “EE-68.” This document is updated regularly to keep pace with improvements to emulator support.

Evaluation Kit

Analog Devices offers a range of EZ-KIT Lite[®] evaluation platforms to use as a cost effective method to learn more about developing or prototyping applications with Analog Devices processors, platforms, and software tools. Each EZ-KIT Lite includes an evaluation board along with an evaluation suite of the VisualDSP++[®] development and debugging environment with the C/C++ compiler, assembler, and linker. Also included are sample application programs, power supply, and a USB cable. All evaluation versions of the software tools are limited for use only with the EZ-KIT Lite product.

The USB controller on the EZ-KIT Lite board connects the board to the USB port of the user's PC, enabling the VisualDSP++ evaluation suite to emulate the on-board processor in-circuit. This permits the customer to download, execute, and debug programs for the EZ-KIT Lite system. It also allows in-circuit programming of the on-board Flash device to store user-specific boot code, enabling the board to run as a stand-alone unit without being connected to the PC.

With a full version of VisualDSP++ installed (sold separately), engineers can develop software for the EZ-KIT Lite or any custom defined system. Connecting one of Analog Devices JTAG emulators to the EZ-KIT Lite board enables high speed, non-intrusive emulation.

ADDITIONAL INFORMATION

This data sheet provides a general overview of the ADSP-2148x architecture and functionality. For detailed information on the ADSP-2148x family core architecture and instruction set, refer to the *SHARC Processor Programming Reference*.

PIN FUNCTION DESCRIPTIONS

Note that the 100 pin package does not support the external port. This includes ADDR, DATA, Memory Selects, AMI and SDRAM Control signals.

Table 9. Pin Descriptions

Name	Type	State During/ After Reset	Description
ADDR ₂₃₋₀	I/O/T (ipu)	High-Z/ driven low (boot)	External Address. The processor outputs addresses for external memory and peripherals on these pins. The ADDR pins can be multiplexed to support the external memory interface data (I/O), and FLAGS ₁₅₋₈ (I/O) and PWM (O). After reset, all DATA pins are in external memory interface mode and FLAG(0-3) pins are in FLAGS mode (default). When configured in the IDP_PDAP_CTL register, IDP channel 0 scans the ADDR ₂₃₋₄ pins for parallel input data.
DATA ₁₅₋₀	I/O/T (ipu)	High-Z	External Data. The data pins can be multiplexed to support the external memory interface data (I/O), and FLAGS ₇₋₀ (I/O).
AMI_ACK	I (ipu)		Memory Acknowledge. External devices can deassert AMI_ACK (low) to add wait states to an external memory access. AMI_ACK is used by I/O devices, memory controllers, or other peripherals to hold off completion of an external memory access.
\overline{MS}_{0-1}	O/T (ipu)	High-Z	Memory Select Lines 0-1. These lines are asserted (low) as chip selects for the corresponding banks of external memory on the AMI interface. The \overline{MS}_{1-0} lines are decoded memory address lines that change at the same time as the other address lines. When no external memory access is occurring the \overline{MS}_{1-0} lines are inactive; they are active however when a conditional memory access instruction is executed, whether or not the condition is true. The \overline{MS}_1 pin can be used in EPORT/FLASH boot mode. For more information, see the <i>ADSP-214xx SHARC Processor Hardware Reference</i> .
$\overline{AMI_RD}$	O/T (ipu)	High-Z	AMI Port Read Enable. $\overline{AMI_RD}$ is asserted whenever the processor reads a word from external memory.
$\overline{AMI_WR}$	O/T (ipu)	High-Z	AMI Port Write Enable. $\overline{AMI_WR}$ is asserted when the processor writes a word to external memory.
FLAG0/ $\overline{IRQ0}$	I/O (ipu)	FLAG[0] INPUT	FLAG0/Interrupt Request0.
FLAG1/ $\overline{IRQ1}$	I/O (ipu)	FLAG[1] INPUT	FLAG1/Interrupt Request1.
FLAG2/ $\overline{IRQ2}/\overline{MS2}$	I/O (ipu)	FLAG[2] INPUT	FLAG2/Interrupt Request2/Memory Select2.
FLAG3/TMREXP/ $\overline{MS3}$	I/O (ipu)	FLAG[3] INPUT	FLAG3/Timer Expired/Memory Select3.

The following symbols appear in the Type column of [Table 9](#): **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be between 26k-63kΩ. The range of an ipd resistor can be between 31k-85kΩ.

In this table, all pins are LVTTTL compliant with the exception of the thermal diode pins.

Not all pins are available in the 100-lead LQFP package. For more information, see [Table 2 on Page 3](#) and [Table 52 on Page 59](#).

Table 9. Pin Descriptions (Continued)

Name	Type	State During/ After Reset	Description
$\overline{\text{SDRAS}}$	O/T (ipu)	High-Z/ driven high	SDRAM Row Address Strobe. Connect to SDRAM's RAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
$\overline{\text{SDCAS}}$	O/T (ipu)	High-Z/ driven high	SDRAM Column Address Select. Connect to SDRAM's CAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
$\overline{\text{SDWE}}$	O/T (ipu)	High-Z/ driven high	SDRAM Write Enable. Connect to SDRAM's WE or W buffer pin.
SDCKE	O/T (ipu)	High-Z/ driven high	SDRAM Clock Enable. Connect to SDRAM's CKE pin. Enables and disables the CLK signal. For details, see the data sheet supplied with the SDRAM device.
SDA10	O/T (ipu)	High-Z/ driven high	SDRAMA10 Pin. Enables applications to refresh an SDRAM in parallel with non-SDRAM accesses. This pin replaces the DSP's A10 pin only during SDRAM accesses.
SDDQM	O/T (ipu)	High-Z/ driven high	DQM Data Mask. SDRAM Input mask signal for write accesses and output mask signal for read accesses. Input data is masked when DQM is sampled high during a write cycle. The SDRAM output buffers are placed in a High-Z state when DQM is sampled high during a read cycle. SDDQM is driven high from reset de-assertion until SDRAM initialization completes. Afterwards it is driven low irrespective of whether any SDRAM accesses occur or not.
SDCLK	O/T (ipd)	High-Z/ driving	SDRAM Clock Output. Clock driver for this pin differs from all other clock drivers. See Figure 43 on page 56 .
DAI_P20-1	I/O/T (ipu)	High-Z	Digital Applications Interface. These pins provide the physical interface to the DAI SRU. The DAI SRU configuration registers define the combination of on-chip audio-centric peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DAI SRU may be routed to any of these pins. The DAI SRU provides the connection from the serial ports, the S/PDIF module, input data ports (2), and the precision clock generators (4), to the DAI_P20-1 pins.
DPI_P14-1	I/O/T (ipu)	High-Z	Digital Peripheral Interface. These pins provide the physical interface to the DPI SRU. The DPI SRU configuration registers define the combination of on-chip peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DPI SRU may be routed to any of these pins. The DPI SRU provides the connection from the timers (2), SPIs (2), UART (1), flags (12), and general-purpose I/O (9) to the DPI_P14-1 pins.
WDT_CLKIN	I		Watch Dog Timer Clock Input. This pin should be pulled low when not used.
WDT_CLKO	O		Watch Dog Resonator Pad Output.
$\overline{\text{WDRSTO}}$	O (ipu)		Watch Dog Timer Reset Out.
THD_P	I		Thermal Diode Anode. When not used, this pin can be left floating.
THD_M	O		Thermal Diode Cathode. When not used, this pin can be left floating.

The following symbols appear in the Type column of [Table 9](#): **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be between 26k-63kΩ. The range of an ipd resistor can be between 31k-85kΩ.

In this table, all pins are LVTTTL compliant with the exception of the thermal diode pins.

Not all pins are available in the 100-lead LQFP package. For more information, see [Table 2 on Page 3](#) and [Table 52 on Page 59](#).

Table 9. Pin Descriptions (Continued)

Name	Type	State During/ After Reset	Description
MLBCLK ¹	I		Media Local Bus Clock. This clock is generated by the MLB controller that is synchronized to the MOST network and provides the timing for the entire MLB interface at 49.152 MHz at Fs=48 kHz. When the MLB controller is not used, this pin should be grounded.
MLBDAT ³	I/O/T in 3 pin mode. I in 5 pin mode.	High-Z	Media Local Bus Data. The MLBDAT line is driven by the transmitting MLB device and is received by all other MLB devices including the MLB controller. The MLBDAT line carries the actual data. In 5-pin MLB mode, this pin is an input only. When the MLB controller is not used, this pin should be grounded.
MLBSIG ³	I/O/T in 3 pin mode. I in 5 pin mode	High-Z	Media Local Bus Signal. This is a multiplexed signal which carries the Channel/Address generated by the MLB Controller, as well as the Command and RxStatus bytes from MLB devices. In 5-pin mode, this pin is input only. When the MLB controller is not used, this pin should be grounded.
MLBDO ³	O/T	High-Z	Media Local Bus Data Output (in 5 pin mode). This pin is used only in 5-pin MLB mode. This serves as the output data pin in 5-pin mode. When the MLB controller is not used, this pin can be left floating.
MLBSO ³	O/T	High-Z	Media Local Bus Signal Output (in 5 pin mode). This pin is used only in 5-pin MLB mode. This serves as the output signal pin in 5-pin mode. When the MLB controller is not used, this pin can be left floating.
TDI	I (ipu)		Test Data Input (JTAG). Provides serial data for the boundary scan logic.
TDO	O/T	High-Z	Test Data Output (JTAG). Serial scan output of the boundary scan path.
TMS	I (ipu)		Test Mode Select (JTAG). Used to control the test state machine.
TCK	I		Test Clock (JTAG). Provides a clock for JTAG boundary scan. TCK must be asserted (pulsed low) after power-up or held low for proper operation of the device.
$\overline{\text{TRST}}$	I (ipu)		Test Reset (JTAG). Resets the test state machine. $\overline{\text{TRST}}$ must be asserted (pulsed low) after power-up or held low for proper operation of the processor.
$\overline{\text{EMU}}$	O/T (ipu)	High-Z	Emulation Status. Must be connected to the ADSP-2148x Analog Devices DSP Tools product line of JTAG emulators target board connector only.

The following symbols appear in the Type column of Table 9: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be between 26k–63k Ω . The range of an ipd resistor can be between 31k–85k Ω .

In this table, all pins are LVTTTL compliant with the exception of the thermal diode pins.

Not all pins are available in the 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 52 on Page 59.

Table 9. Pin Descriptions (Continued)

Name	Type	State During/ After Reset	Description
CLK_CFG ₁₋₀	I		Core to CLKIN Ratio Control. These pins set the start up clock frequency. Note that the operating frequency can be changed by programming the PLL multiplier and divider in the PMCTL register at any time after the core comes out of reset. The allowed values are: 00 = 8:1 01 = 32:1 10 = 16:1 11 = reserved
CLKIN	I		Local Clock In. Used in conjunction with XTAL. CLKIN is the clock input. It configures the processors to use either its internal clock generator or an external clock source. Connecting the necessary components to CLKIN and XTAL enables the internal clock generator. Connecting the external clock to CLKIN while leaving XTAL unconnected configures the processors to use the external clock source such as an external clock oscillator. CLKIN may not be halted, changed, or operated below the specified frequency.
XTAL	O		Crystal Oscillator Terminal. Used in conjunction with CLKIN to drive an external crystal.
$\overline{\text{RESET}}$	I		Processor Reset. Resets the processor to a known state. Upon deassertion, there is a 4096 CLKIN cycle latency for the PLL to lock. After this time, the core begins program execution from the hardware reset vector address. The $\overline{\text{RESET}}$ input must be asserted (low) at power-up.
$\overline{\text{RESETOUT}}$ / RUNRSTIN	I/O (ipu)		Reset Out/Running Reset In. The default setting on this pin is reset out. This pin also has a second function as RUNRSTIN which is enabled by setting bit 0 of the RUNRSTCTL register. For more information, see the <i>ADSP-214xx SHARC Processor Hardware Reference</i> .
BOOT_CFG ₂₋₀	I		Boot Configuration Select. These pins select the boot mode for the processor (see Table 8). The BOOT_CFG pins must be valid before $\overline{\text{RESET}}$ (hardware and software) is asserted.

The following symbols appear in the Type column of Table 9: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be between 26k–63kΩ. The range of an ipd resistor can be between 31k–85kΩ.

In this table, all pins are LVTTTL compliant with the exception of the thermal diode pins.

Not all pins are available in the 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 52 on Page 59.

¹The MLB pins are only available on the automotive models.

Table 10. Pin List, Power and Ground

Name	Type	Description
V _{DD_INT}	P	Internal Power Supply
V _{DD_EXT}	P	I/O Power Supply
GND ¹	G	Ground
V _{DD_THD}	P	Thermal Diode Power Supply. When not used, this pin can be left floating.

¹The exposed pad is required to be electrically and thermally connected to GND. Implement this by soldering the exposed pad to a GND PCB land that is the same size as the exposed pad. The GND PCB land should be *robustly* connected to the GND plane in the PCB for best electrical and thermal performance. No separate GND pins are provided in the package.

¹ Specifications subject to change without notice.

² Applies to output and bidirectional pins: ADDR23-0, DATA15-0, AMI_RD, AMI_WR, FLAG3-0, DAI_Px, DPI_Px, EMU, TDO, RESETOUT.

³ See [Output Drive Currents on Page 56](#) for typical drive current capabilities.

⁴ Applies to input pins: BOOT_CFGx, CLK_CFGx, TCK, RESET, CLKIN.

⁵ Applies to input pins with internal pull-ups: TRST, TMS, TDI.

⁶ Applies to three-statable pins: TDO, MLBDAT, MLBSIG, MLBDO, and MLBSO.

⁷ Applies to three-statable pins with pull-ups: DAI_Px, DPI_Px, EMU.

⁸ Typical internal current data reflects nominal operating conditions.

⁹ See Engineer-to-Engineer Note "Estimating Power Dissipation for ADSP-2148x SHARC Processors" for further information.

¹⁰ Applies to all signal pins.

¹¹ Guaranteed, but not tested.

PACKAGE INFORMATION

The information presented in [Figure 3](#) provides details about the package branding for the ADSP-2148x processors. For a complete listing of product availability, see [Ordering Guide on Page 65](#).

Figure 3. Typical Package Brand

Table 11. Package Brand Information¹

Brand Key	Field Description
t	Temperature Range
pp	Package Type
Z	RoHS Compliant Option
cc	See Ordering Guide
vvvvv.x	Assembly Lot Code
n.n	Silicon Revision
#	RoHS Compliant Designation
yyww	Date Code

¹ Non Automotive only. For branding information specific to Automotive products, contact Analog Devices Inc.

ESD SENSITIVITY

	<p>ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.</p>
--	---

MAXIMUM POWER DISSIPATION

See Engineer-to-Engineer Note “Estimating Power Dissipation for ADSP-2148x SHARC Processors” for detailed thermal and power information regarding maximum power dissipation. For information on package thermal specifications, see [Thermal Characteristics on Page 57](#).

ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in [Table 12](#) may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions greater than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 12. Absolute Maximum Ratings

Parameter	Rating
Internal (Core) Supply Voltage (V_{DD_INT})	-0.3 V to +1.32 V
External (I/O) Supply Voltage (V_{DD_EXT})	-0.3 V to +4.6 V
Thermal Diode Supply Voltage (V_{DD_THD})	-0.3 V to +4.6 V
Input Voltage	-0.5 V to +3.8 V
Output Voltage Swing	-0.5 V to $V_{DD_EXT} + 0.5 V$
Storage Temperature Range	-65°C to +150°C
Junction Temperature While Biased	125°C

TIMING SPECIFICATIONS

Use the exact timing information given. Do not attempt to derive parameters from the addition or subtraction of others. While addition or subtraction would yield meaningful results for an individual device, the values given in this data sheet reflect statistical variations and worst cases. Consequently, it is not meaningful to add parameters to derive longer times. See [Figure 45 on page 56](#) under [Test Conditions](#) for voltage reference levels.

Switching Characteristics specify how the processor changes its signals. Circuitry external to the processor must be designed for compatibility with these signal characteristics. Switching characteristics describe what the processor will do in a given circumstance. Use switching characteristics to ensure that any timing requirement of a device connected to the processor (such as memory) is satisfied.

Timing Requirements apply to signals that are controlled by circuitry external to the processor, such as the data input for a read operation. Timing requirements guarantee that the processor operates correctly with other devices.

Core Clock Requirements

The processor’s internal clock (a multiple of CLKIN) provides the clock signal for timing internal memory, the processor core, and the serial ports. During reset, program the ratio between the processor’s internal clock frequency and external (CLKIN) clock frequency with the CLK_CFG1-0 pins.

The processor’s internal clock switches at higher frequencies than the system input clock (CLKIN). To generate the internal clock, the processor uses an internal phase-locked loop (PLL, see [Figure 4](#)). This PLL-based clocking minimizes the skew between the system clock (CLKIN) signal and the processor’s internal clock.

Voltage Controlled Oscillator

In application designs, the PLL multiplier value should be selected in such a way that the VCO frequency never exceeds f_{VCO} specified in Table 15.

- The product of CLKIN and PLLM must never exceed 1/2 of f_{VCO} (max) in Table 15 if the input divider is not enabled (INDIV = 0).
- The product of CLKIN and PLLM must never exceed f_{VCO} (max) in Table 15 if the input divider is enabled (INDIV = 1).

The VCO frequency is calculated as follows:

$$f_{VCO} = 2 \times PLLM \times f_{INPUT}$$

$$f_{CCLK} = (2 \times PLLM \times f_{INPUT}) \div PLLD$$

where:

$$f_{VCO} = \text{VCO output}$$

$PLLM$ = Multiplier value programmed in the PMCTL register. During reset, the $PLLM$ value is derived from the ratio selected using the CLK_CFG pins in hardware.

$PLLD$ = 2, 4, 8, or 16 based on the divider value programmed on the PMCTL register. During reset this value is 2.

f_{INPUT} = is the input frequency to the PLL.

$f_{INPUT} = CLKIN$ when the input divider is disabled or

$f_{INPUT} = CLKIN \div 2$ when the input divider is enabled

Note the definitions of the clock periods that are a function of CLKIN and the appropriate ratio control shown in and Table 13. All of the timing specifications for the ADSP-2148x peripherals are defined in relation to t_{PCLK} . See the peripheral specific section for each peripheral's timing information.

Table 13. Clock Periods

Timing Requirements	Description
t_{CK}	CLKIN Clock Period
t_{CCLK}	Processor Core Clock Period
t_{PCLK}	Peripheral Clock Period = $2 \times t_{CCLK}$
t_{SDCLK}	SDRAM Clock Period = $(t_{CCLK}) \times SDCKR$

Figure 4 shows core to CLKIN relationships with external oscillator or crystal. The shaded divider/multiplier blocks denote where clock ratios can be set through hardware or software using the power management control register (PMCTL). For more information, see the ADSP-214xx SHARC Processor Hardware Reference.

Figure 4. Core Clock and System Clock Relationship to CLKIN

Power-Up Sequencing

The timing requirements for processor startup are given in Table 14. While no specific power-up sequencing is required between V_{DD_EXT} and V_{DD_INT} , there are some considerations that system designs should take into account.

- No power supply should be powered up for an extended period of time (> 200 ms) before another supply starts to ramp up.
- If the V_{DD_INT} power supply comes up after V_{DD_EXT} , any pin, such as RESETOUT and RESET may actually drive momentarily until the V_{DD_INT} rail has powered up. Systems

sharing these signals on the board must determine if there are any issues that need to be addressed based on this behavior.

Note that during power-up, when the V_{DD_INT} power supply comes up after V_{DD_EXT} , a leakage current of the order of three-state leakage current pull-up, pull-down, may be observed on any pin, even if that is an input only (for example the RESET pin) until the V_{DD_INT} rail has powered up.

Table 14. Power Up Sequencing Timing Requirements (Processor Startup)

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{RSTVDD}	RESET Low Before V_{DD_EXT} or V_{DD_INT} On	0		ms
$t_{VDDDEVDD}$	V_{DD_INT} On Before V_{DD_EXT}	-200	+200	ms
t_{CLKVDD}^1	CLKIN Valid After V_{DD_INT} and V_{DD_EXT} Valid	0	200	ms
t_{CLKRST}	CLKIN Valid Before RESET Deasserted	10^2		ms
t_{PLLST}	PLL Control Setup Before RESET Deasserted	20^3		ms
<i>Switching Characteristic</i>				
$t_{CORERST}$	Core Reset Deasserted After RESET Deasserted	$4096 \times t_{CK} + 2 \times t_{CCLK}^{4,5}$		ms

¹Valid V_{DD_INT} and V_{DD_EXT} assumes that the supplies are fully ramped to their nominal values (it does not matter which supply comes up first). Voltage ramp rates can vary from microseconds to hundreds of milliseconds depending on the design of the power supply subsystem.
²Assumes a stable CLKIN signal, after meeting worst-case startup timing of crystal oscillators. Refer to your crystal oscillator manufacturer's data sheet for startup time. Assume a 25 ms maximum oscillator startup time if using the XTAL pin and internal oscillator circuit in conjunction with an external crystal.
³Based on CLKIN cycles.
⁴Applies after the power-up sequence is complete. Subsequent resets require a minimum of four CLKIN cycles for RESET to be held low in order to properly initialize and propagate default states at all I/O pins.
⁵The 4096 cycle count depends on t_{SRST} specification in Table 16. If setup time is not met, one additional CLKIN cycle may be added to the core reset time, resulting in 4097 cycles maximum.

Figure 5. Power-Up Sequencing

Clock Input

Table 15. Clock Input

Parameter	350 MHz		400 MHz		Unit	
	Min	Max	Min	Max		
<i>Timing Requirements</i>						
t_{CK}	CLKIN Period	22.8 ¹	100 ²	20 ¹	100 ²	ns
t_{CKL}	CLKIN Width Low	11	45	10	45	ns
t_{CKH}	CLKIN Width High	11	45	10	45	ns
t_{CKRF}	CLKIN Rise/Fall (0.4 V to 2.0 V)		3		3	ns
t_{CCLK} ³	CCLK Period	2.85	10	2.5	10	ns
f_{VCO} ⁴	VCO Frequency	200	700	200	800	MHz
t_{CKJ} ^{5,6}	CLKIN Jitter Tolerance	-250	+250	-250	+250	ps

¹ Applies only for CLK_CFG1-0 = 00 and default values for PLL control bits in PMCTL.
² Applies only for CLK_CFG1-0 = 01 and default values for PLL control bits in PMCTL.
³ Any changes to PLL control bits in the PMCTL register must meet core clock timing specification t_{CCLK} .
⁴ See Figure 4 on page 21 for VCO diagram.
⁵ Actual input jitter should be combined with ac specifications for accurate timing analysis.
⁶ Jitter specification is maximum peak-to-peak time interval error (TIE) jitter.

Figure 6. Clock Input

Clock Signals

The ADSP-2148x can use an external clock or a crystal. See the CLKIN pin description in Table 9 on Page 14. Programs can configure the processor to use its internal clock generator by connecting the necessary components to CLKIN and XTAL. Figure 7 shows the component connections used for a crystal

operating in fundamental mode. Note that the clock rate is achieved using a 25 MHz crystal and a PLL multiplier ratio 16:1 (CCLK:CLKIN achieves a clock speed of 400 MHz). To achieve the full core clock rate, programs need to configure the multiplier bits in the PMCTL register.

R2 SHOULD BE CHOSEN TO LIMIT CRYSTAL DRIVE POWER. REFER TO CRYSTAL MANUFACTURER'S SPECIFICATIONS

*TYPICAL VALUES

Figure 7. Recommended Circuit for Fundamental Mode Crystal Operation

Reset

Table 16. Reset

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{WRST}^1 $\overline{\text{RESET}}$ Pulse Width Low	$4t_{CK}$		ns
t_{SRST} $\overline{\text{RESET}}$ Setup Before CLKIN Low	8		ns

¹Applies after the power-up sequence is complete. At power-up, the processor's internal phase-locked loop requires no more than 100 μs while $\overline{\text{RESET}}$ is low, assuming stable V_{DD} and CLKIN (not including start-up time of external clock oscillator).

Figure 8. Reset

Running Reset

The following timing specification applies to $\overline{\text{RESETOUT}}/\overline{\text{RUNRSTIN}}$ pin when it is configured as $\overline{\text{RUNRSTIN}}$.

Table 17. Running Reset

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
$t_{WRUNRST}$ Running $\overline{\text{RESET}}$ Pulse Width Low	$4 \times t_{CK}$		ns
$t_{SRUNRST}$ Running $\overline{\text{RESET}}$ Setup Before CLKIN High	8		ns

Figure 9. Running Reset

Interrupts

The following timing specification applies to the FLAG0, FLAG1, and FLAG2 pins when they are configured as $\overline{\text{IRQ0}}$, $\overline{\text{IRQ1}}$, and $\overline{\text{IRQ2}}$ interrupts as well as the DAI_P20-1 and DPI_P14-1 pins when they are configured as interrupts.

Table 18. Interrupts

Parameter	Min	Max	Unit
<i>Timing Requirement</i>

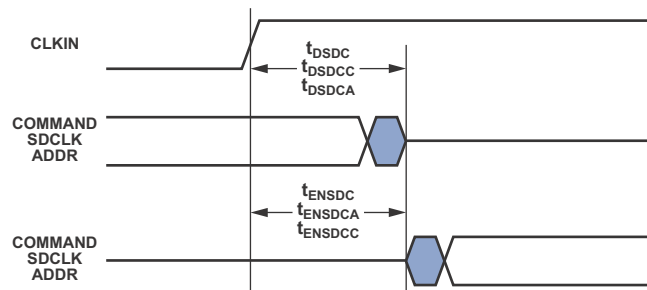

Figure 19. SDRAM Interface Enable/Disable Timing

Memory Read—Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for AMI_ACK, ADDR, DATA, AMI_RD, AMI_WR, and strobe timing parameters only apply to asynchronous access mode.

Table 28. Memory Read—Bus Master

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{DAD} Address, Selects Delay to Data Valid ^{1,2}		$W + t_{SDCLK} - 5.12$	ns
t_{DRLD} $\overline{AMI_RD}$ Low to Data Valid ¹		$W - 3.2$	ns
t_{SDS} Data Setup to $\overline{AMI_RD}$ High	2.5		ns
t_{HDRH} Data Hold from $\overline{AMI_RD}$ High ^{3,4}	0		ns
t_{DAAK} AMI_ACK Delay from Address, Selects ^{2,5}		$t_{SDCLK} - 9.5 + W$	ns
t_{DSAK} AMI_ACK Delay from $\overline{AMI_RD}$ Low ⁴		$W - 7.0$	ns
<i>Switching Characteristics</i>			
t_{DRHA} Address Selects Hold After $\overline{AMI_RD}$ High	RHC + 0.20		ns
t_{DARL} Address Selects to $\overline{AMI_RD}$ Low ²	$t_{SDCLK} - 3.3$		ns
t_{RW} $\overline{AMI_RD}$ Pulse Width	$W - 1.4$		ns
t_{RWR} $\overline{AMI_RD}$ High to $\overline{AMI_WR}$, $\overline{AMI_RD}$ Low ⁶	$HI + t_{SDCLK} - 0.8$		ns

$W = (\text{number of wait states specified in AMICTLx register}) \times t_{SDCLK}$.

$HI = RHC + IC$ (RHC = (number of Read Hold Cycles specified in AMICTLx register) $\times t_{SDCLK}$)

$IC = (\text{number of idle cycles specified in AMICTLx register}) \times t_{SDCLK}$.

$H = (\text{number of hold cycles specified in AMICTLx register}) \times t_{SDCLK}$.

¹Data delay/setup: System must meet t_{DAD} , t_{DRLD} , or t_{SDS} .

²The falling edge of \overline{MSx} , is referenced.

³Note that timing for AMI_ACK, ADDR, DATA, $\overline{AMI_RD}$, $\overline{AMI_WR}$, and strobe timing parameters only apply to asynchronous access mode.

⁴Data hold: User must meet t_{HDRH} in asynchronous access mode. See [Test Conditions on Page 56](#) for the calculation of hold times given capacitive and dc loads.

⁵AMI_ACK delay/setup: User must meet t_{DAAK} , or t_{DSAK} , for deassertion of AMI_ACK (low). For asynchronous assertion of AMI_ACK (high) user must meet t_{DAAK} or t_{DSAK} .

⁶For Read to Read: Same bank = $(1 + RHC) \times SDCLK$ if IC is not programmed. For Read to Read: Different bank = t_{RWR} . For Read to Write: 5 SDCLK cycles + $(IC - 4)$, at least 5 SDCLK cycles for both the same bank and different banks.

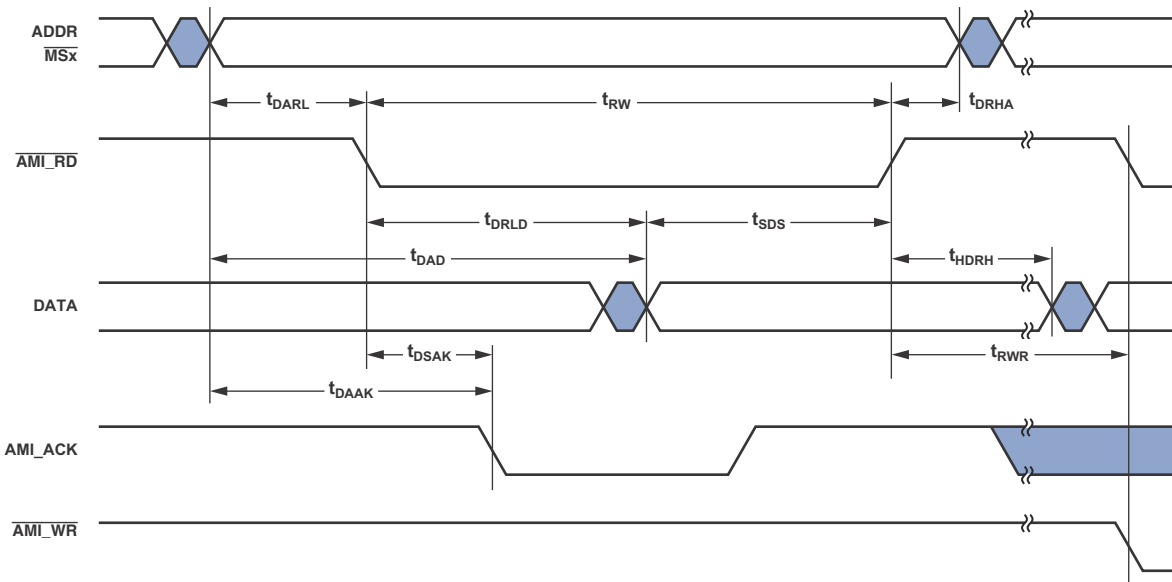

Figure 20. Memory Read—Bus Master

Memory Write—Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for AMI_ACK, ADDR, DATA, AMI_RD, AMI_WR, and strobe timing parameters only apply to asynchronous access mode.

Table 29. Memory Write—Bus Master

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{DAAK} AMI_ACK Delay from Address, Selects ^{1,2}		$t_{SDCLK} - 9.7 + W$	ns
t_{DSAK} AMI_ACK Delay from $\overline{AMI_WR}$ Low ^{1,3}		$W - 4.9$	ns
<i>Switching Characteristics</i>			
t_{DAWH} Address, Selects to $\overline{AMI_WR}$ Deasserted ²	$t_{SDCLK} - 3.1 + W$		ns
t_{DAWL} Address, Selects to $\overline{AMI_WR}$ Low ²	$t_{SDCLK} - 2.7$		ns
t_{WW} $\overline{AMI_WR}$ Pulse Width	$W - 1.3$		ns
t_{DDWH} Data Setup Before $\overline{AMI_WR}$ High	$t_{SDCLK} - 3.0 + W$		ns
t_{DWHa} Address Hold After $\overline{AMI_WR}$ Deasserted	$H + 0.15$		ns
t_{DWHd} Data Hold After $\overline{AMI_WR}$ Deasserted	$H + 0.02$		ns
t_{DATRWH} Data Disable After $\overline{AMI_WR}$ Deasserted ⁴	TBD		ns
t_{WWR} $\overline{AMI_WR}$ High to $\overline{AMI_WR}$, $\overline{AMI_RD}$ Low ⁵	$t_{SDCLK} - 1.5 + H$		ns
t_{DDWR} Data Disable Before $\overline{AMI_RD}$ Low	$2 \times t_{SDCLK} - 4.11$		ns
t_{WDE} $\overline{AMI_WR}$ Low to Data Enabled	$t_{SDCLK} - 3.5$		ns

$W = (\text{number of wait states specified in AMICTLx register}) \times t_{SDCLK}$

$H = (\text{number of hold cycles specified in AMICTLx register}) \times t_{SDCLK}$

¹ AMI_ACK delay/setup: System must meet t_{DAAK} or t_{DSAK} , for deassertion of AMI_ACK (low). For asynchronous assertion of AMI_ACK (high) user must meet t_{DAAK} or t_{DSAK} .

² The falling edge of \overline{MSx} is referenced.

³ Note that timing for AMI_ACK, ADDR, DATA, $\overline{AMI_RD}$, $\overline{AMI_WR}$, and strobe timing parameters only applies to asynchronous access mode.

⁴ See Test Conditions on Page 56 for calculation of hold times given capacitive and dc loads.

⁵ For Write to Write: 1 + HC, for both same bank and different bank. For Write to Read: 3 SDCLK cycles + HC, for the same bank and different banks.

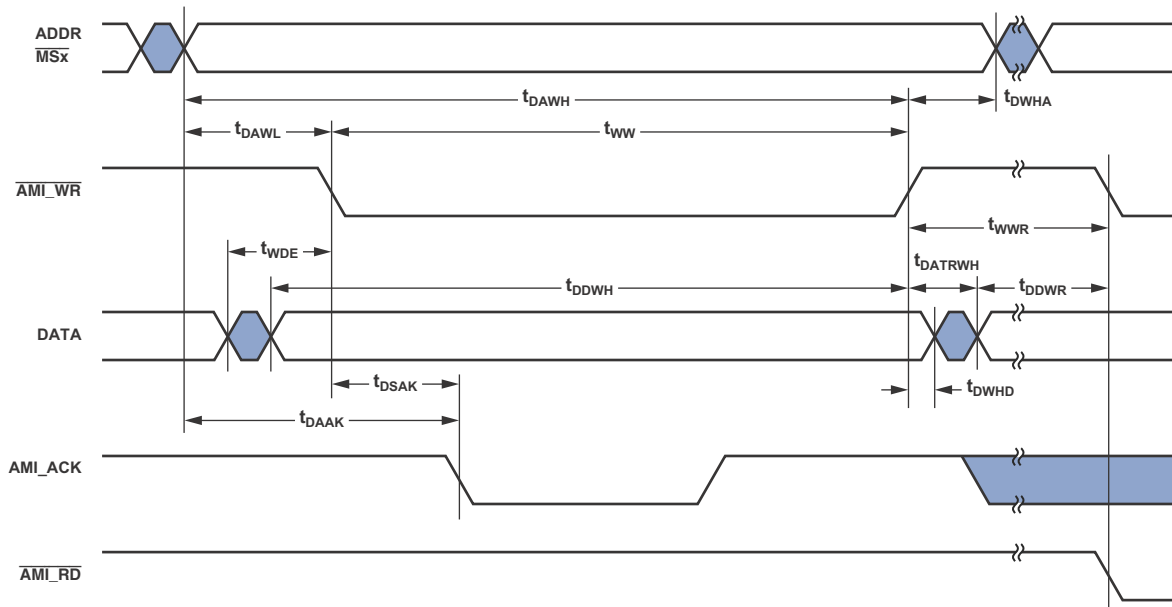

Figure 21. Memory Write—Bus Master

Serial Ports

To determine whether communication is possible between two devices at clock speed n, the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) SCLK width.

Serial port signals (SCLK, FS, Data Channel A, Data Channel B) are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 30. Serial Ports—External Clock

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t _{SFSE} ¹ Frame Sync Setup Before SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode)	2.5		ns
t _{HFSE} ¹ Frame Sync Hold After SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode)	2.5		ns
t _{SDRE} ¹ Receive Data Setup Before Receive SCLK	1.9		ns
t _{HDRE} ¹ Receive Data Hold After SCLK	2.5		ns
t _{SCLKW} SCLK Width	(t _{PCLK} × 4) ÷ 2 – 0.5		ns
t _{SCLK} SCLK Period	t _{PCLK} × 4		ns
<i>Switching Characteristics</i>			
t _{DFSE} ² Frame Sync Delay After SCLK (Internally Generated Frame Sync in either Transmit or Receive Mode)		10.25	ns
t _{HOFSE} ² Frame Sync Hold After SCLK (Internally Generated Frame Sync in either Transmit or Receive Mode)	2		ns
t _{DDTE} ² Transmit Data Delay After Transmit SCLK		7.8	ns
t _{HDTE} ² Transmit Data Hold After Transmit SCLK	2		ns

¹Referenced to sample edge.

²Referenced to drive edge.

Table 31. Serial Ports—Internal Clock

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t _{SFSI} ¹ Frame Sync Setup Before SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode)	7		ns
t _{HFSI} ¹ Frame Sync Hold After SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode)	2.5		ns
t _{SDRI} ¹ Receive Data Setup Before SCLK	7		ns
t _{HDRI} ¹ Receive Data Hold After SCLK	2.5		ns
<i>Switching Characteristics</i>			
t _{DFSI} ² Frame Sync Delay After SCLK (Internally Generated Frame Sync in Transmit Mode)		4	ns
t _{HFSI} ² Frame Sync Hold After SCLK (Internally Generated Frame Sync in Transmit Mode)	–1.0		ns
t _{DFSIR} ² Frame Sync Delay After SCLK (Internally Generated Frame Sync in Receive Mode)		9.75	ns
t _{HFSIR} ² Frame Sync Hold After SCLK (Internally Generated Frame Sync in Receive Mode)	–1.0		ns
t _{DDTI} ² Transmit Data Delay After SCLK		3.25	ns
t _{HDTI} ² Transmit Data Hold After SCLK	–1.0		ns
t _{SCLKIW} Transmit or Receive SCLK Width	2 × t _{PCLK} – 1.5	2 × t _{PCLK} + 1.5	ns

¹Referenced to the sample edge.

²Referenced to drive edge.

NOTES

- 1. EITHER THE RISING EDGE OR THE FALLING EDGE OF SCLK (EXTERNAL OR INTERNAL) CAN BE USED AS THE ACTIVE SAMPLING EDGE.

NOTES

- 1. EITHER THE RISING EDGE OR THE FALLING EDGE OF SCLK (EXTERNAL OR INTERNAL) CAN BE USED AS THE ACTIVE SAMPLING EDGE.

Figure 22. Serial Ports

Table 32. Serial Ports—External Late Frame Sync

Parameter	Min	Max	Unit
<i>Switching Characteristics</i>			
$t_{DDTLFSE}^1$ Data Delay from Late External Transmit Frame Sync or External Receive Frame Sync with MCE = 1, MFD = 0		7.75	ns
$t_{DDTENFS}^1$ Data Enable for MCE = 1, MFD = 0	0.5		ns

¹The $t_{DDTLFSE}$ and $t_{DDTENFS}$ parameters apply to left-justified as well as DSP serial mode, and MCE = 1, MFD = 0.

NOTES
 1. SERIAL PORT SIGNALS (SCLK, FS, DATA CHANNEL A/B) ARE ROUTED TO THE DAI_P20-1 PINS USING THE SRU. THE TIMING SPECIFICATIONS PROVIDED HERE ARE VALID AT THE DAI_P20-1 PINS. THE CHARACTERIZED SPORT AC TIMINGS ARE APPLICABLE WHEN INTERNAL CLOCKS AND FRAMES ARE LOOPED BACK FROM THE PIN, NOT ROUTED DIRECTLY THROUGH THE SRU.

Figure 23. External Late Frame Sync¹

¹This figure reflects changes made to support left-justified mode.

¹Referenced to drive edge.

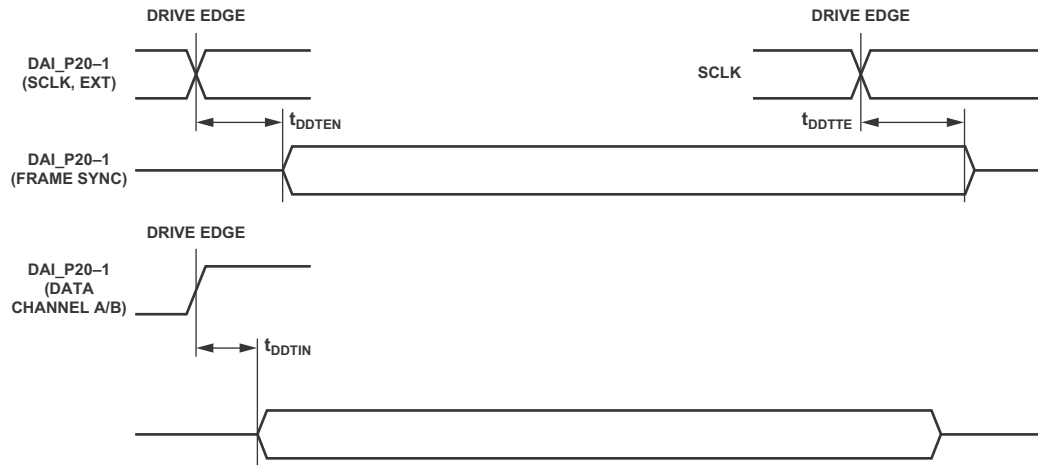

Figure 24. Serial Ports—Enable and Three-State

Input Data Port (IDP)

The timing requirements for the IDP are given in Table 34. IDP signals are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 34. Input Data Port (IDP)

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SISFS}^1 Frame Sync Setup Before Serial Clock Rising Edge	4		ns
t_{SIHFS}^1 Frame Sync Hold After Serial Clock Rising Edge	2.5		ns
t_{SISD}^1 Data Setup Before Serial Clock Rising Edge	2.5		ns
t_{SIHD}^1 Data Hold After Serial Clock Rising Edge	2.5		ns
$t_{IDPCLKW}$ Clock Width	$(t_{PCLK} \times 4) \div 2 - 1$		ns
t_{IDPCLK} Clock Period	$t_{PCLK} \times 4$		ns

¹ The serial clock, data and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

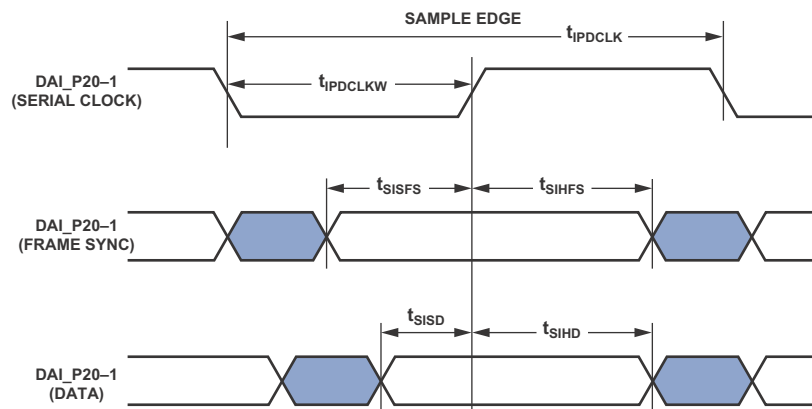

Figure 25. IDP Master Timing

Parallel Data Acquisition Port (PDAP)

The timing requirements for the PDAP are provided in [Table 35](#). PDAP is the parallel mode operation of Channel 0 of the IDP. For details on the operation of the PDAP, see the

PDAP chapter of the *ADSP-214xx SHARC Processor Hardware Reference*. Note that the 20-bits of external PDAP data can be provided through the ADDR23-0 pins or over the DAI pins.

Table 35. Parallel Data Acquisition Port (PDAP)

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SPHOLD}^1	PDAP_HOLD Setup Before PDAP_CLK Sample Edge	2.5	ns
t_{HPHOLD}^1	PDAP_HOLD Hold After PDAP_CLK Sample Edge	2.5	ns
t_{PDS}^1	PDAP_DAT Setup Before SCLK PDAP_CLK Sample Edge	3.85	ns
t_{PDHD}^1	PDAP_DAT Hold After SCLK PDAP_CLK Sample Edge	2.5	ns
t_{PDCLKW}	Clock Width	$(t_{PCLK} \times 4) \div 2 - 3$	ns
t_{PDCLK}	Clock Period	$t_{PCLK} \times 4$	ns
<i>Switching Characteristics</i>			
t_{PDHDD}	Delay of PDAP Strobe After Last PDAP_CLK Capture Edge for a Word	$2 \times t_{PCLK} + 3$	ns
t_{PDSTRB}	PDAP Strobe Pulse Width	$2 \times t_{PCLK} - 1$	ns

¹ Source pins of DATA are ADDR23-0 or DAI pins. Source pins for SCLK and FS are: 1) DAI pins, 2) CLKIN through PCG, or 3) DAI pins through PCG.

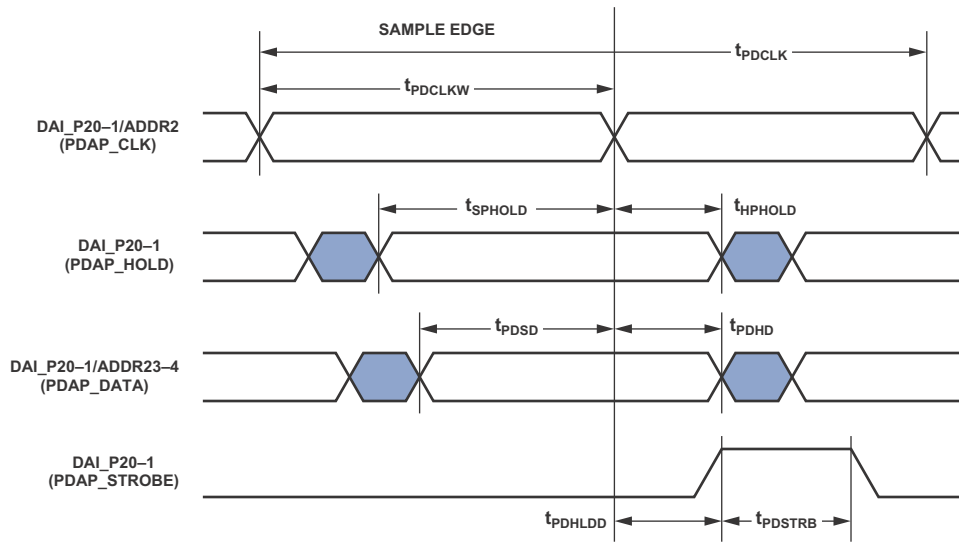

Figure 26. PDAP Timing

Sample Rate Converter—Serial Input Port

The ASRC input signals are routed from the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided in [Table 36](#) are valid at the DAI_P20-1 pins.

Table 36. ASRC, Serial Input Port

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SRCSFS}^1	4		ns
t_{SRCHFS}^1	5.5		ns
$t_{SRCS D}^1$	4		ns
$t_{SRCH D}^1$	5.5		ns
t_{SRCLLW}		$(t_{PCLK} \times 4) \div 2 - 1$	ns
t_{SRCLK}		$t_{PCLK} \times 4$	ns

¹ The serial clock, data and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 27. ASRC Serial Input Port Timing

Sample Rate Converter—Serial Output Port

For the serial output port, the frame-sync is an input and it should meet setup and hold times with regard to SCLK on the output port. The serial data output has a hold time and delay

specification with regard to serial clock. Note that serial clock rising edge is the sampling edge and the falling edge is the drive edge.

Table 37. ASRC, Serial Output Port

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SRCSFS}^1 Frame Sync Setup Before Serial Clock Rising Edge	4		ns
t_{SRCHFS}^1 Frame Sync Hold After Serial Clock Rising Edge	5.5		ns
t_{SRCLLW} Clock Width	$(t_{PCLK} \times 4) \div 2 - 1$		ns
t_{SRCLK} Clock Period	$t_{PCLK} \times 4$		ns
<i>Switching Characteristics</i>			
t_{SRCTDD}^1 Transmit Data Delay After Serial Clock Falling Edge		9.9	ns
t_{SRCTDH}^1 Transmit Data Hold After Serial Clock Falling Edge	1		ns

¹The serial clock, data and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

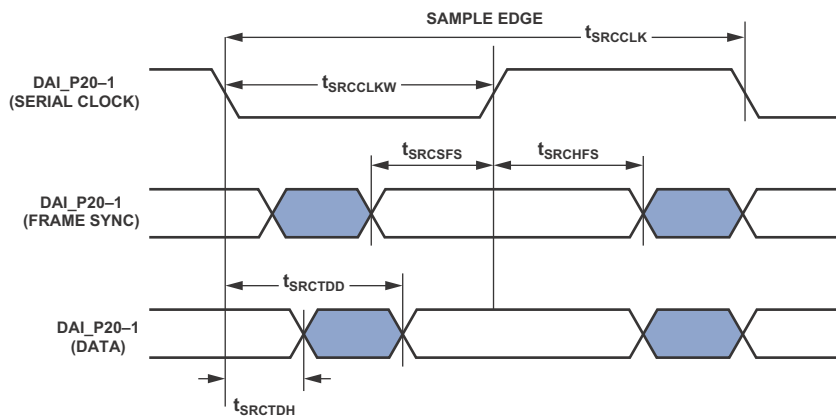

Figure 28. ASRC Serial Output Port Timing

Pulse-Width Modulation Generators (PWM)

The following timing specifications apply when the ADDR23-8/DPI_14-1 pins are configured as PWM.

Table 38. Pulse-Width Modulation (PWM) Timing

Parameter	Min	Max	Unit
<i>Switching Characteristics</i>			
t_{PWMW} PWM Output Pulse Width	$t_{PCLK} - 2$	$(2^{16} - 2) \times t_{PCLK} - 2$	ns
t_{PWMP} PWM Output Period	$2 \times t_{PCLK} - 1.5$	$(2^{16} - 1) \times t_{PCLK} - 1.5$	ns

Figure 29. PWM Timing

S/PDIF Transmitter

Serial data input to the S/PDIF transmitter can be formatted as left justified, I²S, or right justified with word widths of 16-, 18-, 20-, or 24-bits. The following sections provide timing for the transmitter.

S/PDIF Transmitter-Serial Input Waveforms

Figure 30 shows the right-justified mode. LRCLK is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is delayed 12-bit clock periods (in 20-bit output mode) or 16-bit clock periods (in 16-bit

output mode) from an LRCLK transition, so that when there are 64 Serial clock periods per LRCLK period, the LSB of the data will be right-justified to the next LRCLK transition.

Figure 31 shows the default I²S mode. LRCLK is low for the left channel and high for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to an LRCLK transition but with a single Serial Clock period delay.

Figure 32 shows the left-justified mode. LRCLK is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to an LRCLK transition with no MSB delay.

Figure 30. Right-Justified Mode

Figure 31. I²S Mode

Figure 32. Left-Justified Mode

S/PDIF Transmitter Input Data Timing

The timing requirements for the S/PDIF transmitter are given in Table 39. Input signals are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 39. S/PDIF Transmitter Input Data Timing

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SISFS}^1	3		ns
t_{SIHFS}^1	3		ns
t_{SISD}^1	3		ns
t_{SIHD}^1	3		ns
$t_{SIHFCLKW}$	9		ns
$t_{SIHFCLK}$	20		ns
$t_{SISCLKW}$	36		ns
t_{SISCLK}	80		ns

¹ The serial clock, data and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

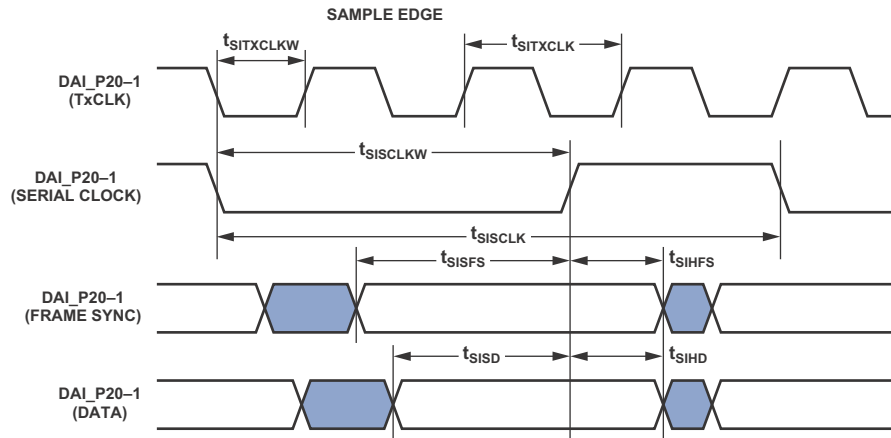

Figure 33. S/PDIF Transmitter Input Timing

Oversampling Clock (HFCLK) Switching Characteristics

The S/PDIF transmitter has an oversampling clock. This HFCLK input is divided down to generate the biphase clock.

Table 40. Over Sampling Clock (HFCLK) Switching Characteristics

Parameter	Max	Unit
HFCLK Frequency for HFCLK = 384 × Frame Sync	Oversampling Ratio × Frame Sync ≤ 1/ $t_{SIHFCLK}$	MHz
HFCLK Frequency for HFCLK = 256 × Frame Sync	49.2	MHz
Frame Rate (FS)	192.0	kHz

S/PDIF Receiver

The following section describes timing as it relates to the S/PDIF receiver.

Internal Digital PLL Mode

In the internal digital phase-locked loop mode the internal PLL (digital PLL) generates the $512 \times FS$ clock.

Table 41. S/PDIF Receiver Internal Digital PLL Mode Timing

Parameter		Min	Max	Unit
<i>Switching Characteristics</i>				
t_{DFSI}	LRCLK Delay After Serial Clock		5	ns
t_{HOFSI}	LRCLK Hold After Serial Clock	-2		ns
t_{DDTI}	Transmit Data Delay After Serial Clock		5	ns
t_{HDTI}	Transmit Data Hold After Serial Clock	-2		ns
t_{SCLKIW}^1	Transmit Serial Clock Width	40		ns

¹ SCLK frequency is $64 \times$ frame sync where FS = the frequency of LRCLK.

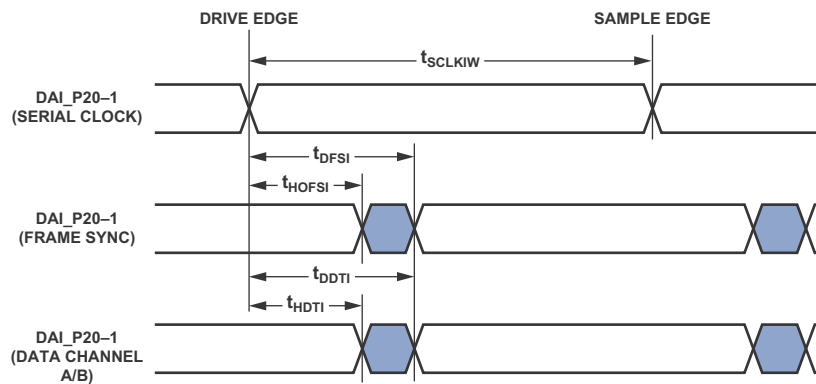

Figure 34. S/PDIF Receiver Internal Digital PLL Mode Timing

SPI Interface—Master

The ADSP-2148x contains two SPI ports. Both primary and secondary are available through DPI only. The timing provided in Table 42 and Table 43 applies to both.

Table 42. SPI Interface Protocol—Master Switching and Timing Specifications

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{SSPIDM}	Data Input Valid To SPICLK Edge (Data Input Setup Time)	8.2		ns
t_{HSPIDM}	SPICLK Last Sampling Edge To Data Input Not Valid	2		ns
<i>Switching Characteristics</i>				
$t_{SPICLKM}$	Serial Clock Cycle	$8 \times t_{PCLK} - 2$		ns
t_{SPICHM}	Serial Clock High Period	$4 \times t_{PCLK} - 2$		ns
t_{SPICLM}	Serial Clock Low Period	$4 \times t_{PCLK} - 2$		ns
$t_{DDSPIDM}$	SPICLK Edge to Data Out Valid (Data Out Delay Time)		2.5	
$t_{HDSPIDM}$	SPICLK Edge to Data Out Not Valid (Data Out Hold Time)	$4 \times t_{PCLK} - 2$		ns
t_{SDSCIM}	DPI Pin (SPI Device Select) Low to First SPICLK Edge	$4 \times t_{PCLK} - 2$		ns
t_{HDSM}	Last SPICLK Edge to DPI Pin (SPI Device Select) High	$4 \times t_{PCLK} - 2$		ns
t_{SPITDM}	Sequential Transfer Delay	$4 \times t_{PCLK} - 1$		ns

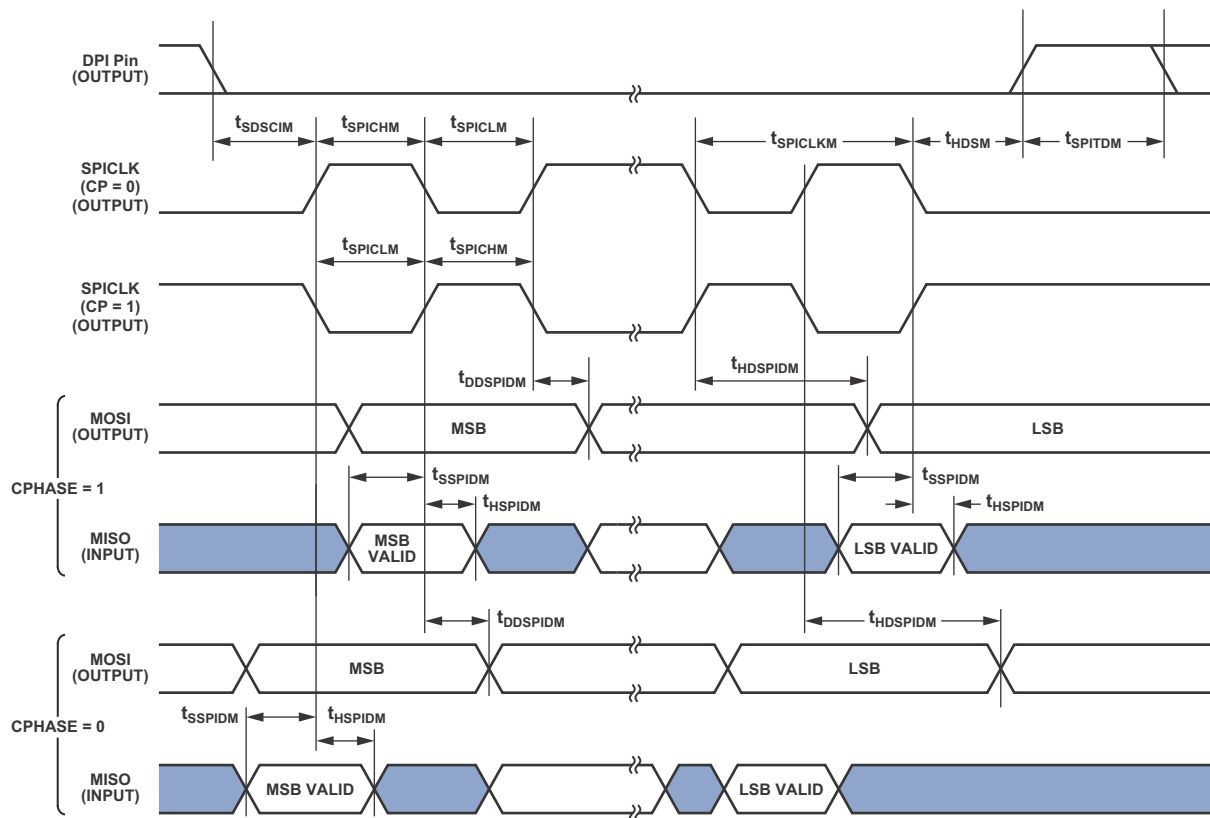

Figure 35. SPI Master Timing

SPI Interface—Slave**Table 43. SPI Interface Protocol—Slave Switching and Timing Specifications**

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{SPICLK}	Serial Clock Cycle	$4 \times t_{PCLK} - 2$		ns
t_{SPICH}	Serial Clock High Period	$2 \times t_{PCLK} - 2$		ns
t_{SPICL}	Serial Clock Low Period	$2 \times t_{PCLK} - 2$		ns
t_{SDSCO}	\overline{SPIDS} Assertion to First SPICLK Edge	$2 \times t_{PCLK}$		ns
	CPHASE = 0			ns
t_{HDS}	CPHASE = 1			ns
	Last SPICLK Edge to \overline{SPIDS} Not Asserted, CPHASE = 0	$2 \times t_{PCLK}$		ns
t_{SSPIDS}	Data Input Valid to SPICLK edge (Data Input Set-up Time)	2		ns
t_{HSPIDS}	SPICLK Last Sampling Edge to Data Input Not Valid	2		ns
t_{SDPPW}	\overline{SPIDS} Deassertion Pulse Width (CPHASE=0)	$2 \times t_{PCLK}$		ns
<i>Switching Characteristics</i>				
t_{DSOE}	\overline{SPIDS} Assertion to Data Out Active	0	6.8	ns
t_{DSOE}^1	\overline{SPIDS} Assertion to Data Out Active (SPI2)	0	8	ns
t_{DSDHI}	\overline{SPIDS} Deassertion to Data High Impedance	0	6.8	ns
t_{DSDHI}^1	\overline{SPIDS} Deassertion to Data High Impedance (SPI2)	0	8.6	ns
$t_{DDSPIDS}$	SPICLK Edge to Data Out Valid (Data Out Delay Time)		9.5	ns
$t_{HDSPIDS}$	SPICLK Edge to Data Out Not Valid (Data Out Hold Time)	$2 \times t_{PCLK}$		ns
t_{DSOV}	\overline{SPIDS} Assertion to Data Out Valid (CPHASE = 0)		$5 \times t_{PCLK}$	ns

¹The timing for these parameters applies when the SPI is routed through the signal routing unit. For more information, see the processor hardware reference, "Serial Peripheral Interface Port" chapter.

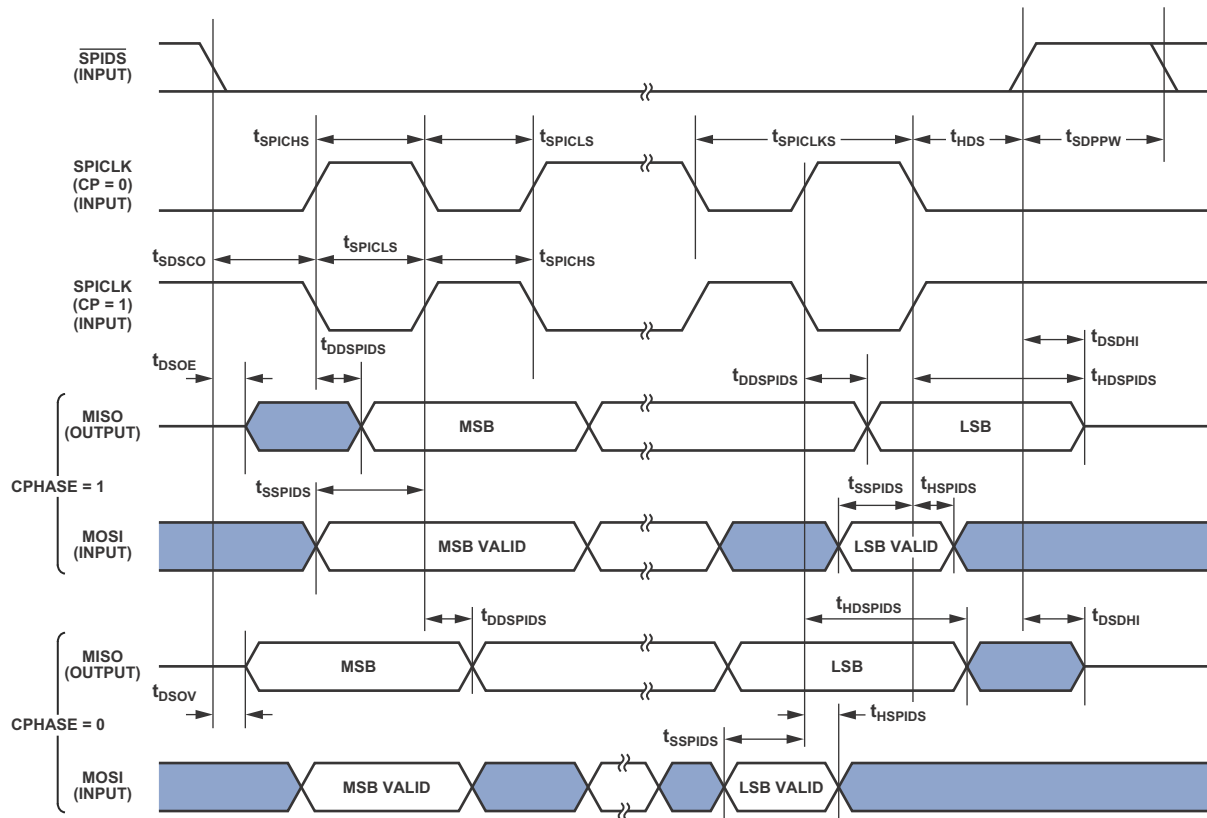

Figure 36. SPI Slave Timing

Universal Asynchronous Receiver-Transmitter (UART) Port—Receive and Transmit Timing

Figure 37 describes UART port receive and transmit operations. The maximum baud rate is PCLK/16 where PCLK = 1/tPCLK. As shown in Figure 37 there is some latency between the gener-

ation of internal UART interrupts and the external data operations. These latencies are negligible at the data transmission rates for the UART.

Table 44. UART Port

Parameter	Min	Max	Unit
<i>Timing Requirement</i>			
t _{RXD} ¹ Incoming Data Pulse Width	16 × t _{PCLK} -1		ns
<i>Switching Characteristic</i>			
t _{TXD} ¹ Outgoing Data Pulse Width	16 × t _{PCLK} -1		ns

¹UART signals RXD and TXD are routed through DPI P14-1 pins using the SRU.

Figure 37. UART Port—Receive and Transmit Timing

TWI Controller Timing

Table 45 and Figure 38 provide timing information for the TWI interface. Input Signals (SCL, SDA) are routed to the DPI_P14-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DPI_P14-1 pins.

Table 45. Characteristics of the SDA and SCL Bus Lines for F/S-Mode TWI Bus Devices¹

Parameter		Standard Mode		Fast Mode		Unit
		Min	Max	Min	Max	
f_{SCL}	SCL Clock Frequency	0	100	0	400	kHz
t_{HDSTA}	Hold Time (repeated) Start Condition. After This Period, the First Clock Pulse is Generated.	4.0		0.6		μ s
t_{LOW}	Low Period of the SCL Clock	4.7		1.3		μ s
t_{HIGH}	High Period of the SCL Clock	4.0		0.6		μ s
t_{SUSTA}	Setup Time for a Repeated Start Condition	4.7		0.6		μ s
t_{HDDAT}	Data Hold Time for TWI-bus Devices	0		0		μ s
t_{SUDAT}	Data Setup Time	250		100		ns
t_{SUSTO}	Setup Time for Stop Condition	4.0		0.6		μ s
t_{BUF}	Bus Free Time Between a Stop and Start Condition	4.7		1.3		μ s
t_{SP}	Pulse Width of Spikes Suppressed By the Input Filter	n/a	n/a	0	50	ns

¹All values referred to V_{IHmin} and V_{ILmax} levels. For more information, see Electrical Characteristics on page 19.

Figure 38. Fast and Standard Mode Timing on the TWI Bus

Media Local Bus

All the numbers given are applicable for all speed modes (1024Fs, 512Fs and 256Fs for 3-pin; 512Fs and 256Fs for 5-pin) unless otherwise specified. Please refer to the MediaLB specification document rev 3.0 for more details.

Table 46. MLB Interface, 3-pin Specifications

Parameter	Min	Typ	Max	Unit
<i>Three-Pin Characteristics</i>				
t_{MLBCLK} MLB Clock Period		20.3		ns
	1024Fs	40		ns
	512Fs	81		ns
t_{MCKL} MLBCLK Low Time	6.1			ns
	14			ns
	30			ns
t_{MCKH} MLBCLK High Time	9.3			ns
	14			ns
	30			ns
t_{MCKR} MLBCLK Rise Time (V_{IL} to V_{IH})			1	ns
			3	ns
t_{MCKF} MLBCLK Fall Time (V_{IH} to V_{IL})			1	ns
			3	ns
t_{MPWV}^1 MLBCLK Pulse Width Variation			0.7	nspp
			2.0	nspp
t_{DSMCF} DAT/SIG Input Setup Time	1			ns
t_{DHMCF} DAT/SIG Input Hold Time	0			ns
t_{MCFDZ} DAT/SIG Output Time to Three-state	0		t_{MCKL}	ns
t_{MCDRV} DAT/SIG Output Data Delay From MLBCLK Rising Edge			8	ns
t_{MDZH}^2 Bus Hold Time	2			ns
	4			ns
C_{MLB} DAT/SIG Pin Load			40	pf
			60	pf

¹Pulse width variation is measured at 1.25 V by triggering on one edge of MLBCLK and measuring the spread on the other edge, measured in ns peak-to-peak (pp).

²The board must be designed to insure that the high-impedance bus does not leave the logic state of the final driven bit for this time period. Therefore, coupling must be minimized while meeting the maximum capacitive load listed.

Figure 39. MLB Timing (3-Pin Interface)

Table 47. MLB Interface, 5-pin Specifications

Parameter	Min	Typ	Max	Unit
<i>Five-Pin Characteristics</i>				
t_{MLBCLK} MLB Clock Period		40		ns
512Fs		81		ns
256Fs				
t_{MCKL} MLBCLK Low Time	15			ns
512Fs	30			ns
256Fs				
t_{MCKH} MLBCLK High Time	15			ns
512Fs	30			ns
256Fs				
t_{MCKR} MLBCLK Rise Time (V_{IL} to V_{IH})			6	ns
t_{MCKF} MLBCLK Fall Time (V_{IH} to V_{IL})			6	ns
t_{MPWV}^1 MLBCLK Pulse Width Variation			2	nspp
t_{DSMCF}^2 DAT/SIG Input Setup Time	3			ns
t_{DHMC} DAT/SIG Input Hold Time	5			ns
t_{MCDRV} DS/DO Output Data Delay From MLBCLK Rising Edge			8	ns
t_{MCRDL}^3 DO/SO Low From MLBCLK High			10	ns
512Fs			20	ns
256Fs				
C_{MLB} DS/DO Pin Load			40	pf

¹Pulse width variation is measured at 1.25 V by triggering on one edge of MLBCLK and measuring the spread on the other edge, measured in ns peak-to-peak (pp).

²Gate Delays due to OR'ing logic on the pins must be accounted for.

³When a node is not driving valid data onto the bus, the MLBSO and MLBDO output lines shall remain low. If the output lines can float at anytime, including while in reset, external pull-down resistors are required to keep the outputs from corrupting the MediaLB signal lines when not being driven.

²System Outputs = DAI_Px, DPI_Px ADDR23-0, $\overline{AMI_RD}$, $\overline{AMI_WR}$, FLAG3-0, \overline{SDRAS} , \overline{SDCAS} , \overline{SDWE} , SDCKE, SDA10, SDDQM, SDCLK, MLBDAT, MLBSIG, MLBDO, MLBSO, and EMU.

Figure 42. IEEE 1149.1 JTAG Test Access Port

OUTPUT DRIVE CURRENTS

Figure 43 shows typical I-V characteristics for the output drivers of the ADSP-2148x. The curves represent the current drive capability of the output drivers as a function of output voltage.

Figure 43. Typical Drive at Junction Temperature

TEST CONDITIONS

The ac signal specifications (timing parameters) appear in Table 16 on Page 24 through Table 48 on Page 55. These include output disable time, output enable time, and capacitive loading. The timing specifications for the SHARC apply for the voltage reference levels in Figure 44.

Timing is measured on signals when they cross the 1.5 V level as described in Figure 45. All delays (in nanoseconds) are measured between the point that the first signal reaches 1.5 V and the point that the second signal reaches 1.5 V.

Figure 45. Voltage Reference Levels for AC Measurements

CAPACITIVE LOADING

Output delays and holds are based on standard capacitive loads: 30 pF on all pins (see Figure 44). Figure 48 shows graphically how output delays and holds vary with load capacitance. The graphs of Figure 46, Figure 47, and Figure 48 may not be linear outside the ranges shown for Typical Output Delay vs. Load Capacitance and Typical Output Rise Time (20% to 80%, V = Min) vs. Load Capacitance.

Figure 46. Typical Output Rise/Fall Time (20% to 80%, $V_{DD_EXT} = Max$)

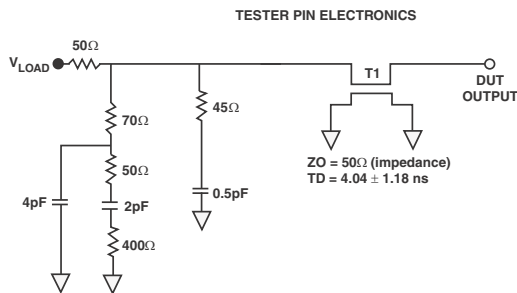

Figure 47. Typical Output Rise/Fall Time (20% to 80%, $V_{DD_EXT} = Min$)

NOTES:
THE WORST CASE TRANSMISSION LINE DELAY IS SHOWN AND CAN BE USED FOR THE OUTPUT TIMING ANALYSIS TO REFLECT THE TRANSMISSION LINE EFFECT AND MUST BE CONSIDERED. THE TRANSMISSION LINE (TD), IS FOR LOAD ONLY AND DOES NOT AFFECT THE DATA SHEET TIMING SPECIFICATIONS.

ANALOG DEVICES RECOMMENDS USING THE IBIS MODEL TIMING FOR A GIVEN SYSTEM REQUIREMENT. IF NECESSARY, A SYSTEM MAY INCORPORATE EXTERNAL DRIVERS TO COMPENSATE FOR ANY TIMING DIFFERENCES.

Figure 44. Equivalent Device Loading for AC Measurements (Includes All Fixtures)

Figure 48. Typical Output Delay or Hold vs. Load Capacitance (at Ambient Temperature)

THERMAL CHARACTERISTICS

The ADSP-2148x processor is rated for performance over the temperature range specified in [Operating Conditions on Page 18](#).

[Table 49](#) airflow measurements comply with JEDEC standards JESD51-2 and JESD51-6 and the junction-to-board measurement complies with JESD51-8. Test board design complies with JEDEC standards JESD51-7 (PBGA). The junction-to-case measurement complies with MIL-STD-883. All measurements use a 2S2P JEDEC test board.

To determine the junction temperature of the device while on the application PCB, use:

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

T_J = junction temperature °C

T_{CASE} = case temperature (°C) measured at the top center of the package

Ψ_{JT} = junction-to-top (of package) characterization parameter is the Typical value from [Table 49](#).

P_D = power dissipation

Values of θ_{JA} are provided for package comparison and PCB design considerations. θ_{JA} can be used for a first order approximation of T_J by the equation:

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where:

T_A = ambient temperature °C

Values of θ_{JC} are provided for package comparison and PCB design considerations when an external heatsink is required.

Values of θ_{JB} are provided for package comparison and PCB design considerations. Note that the thermal characteristics values provided in [Table 49](#) are modeled values.

Table 49. Thermal Characteristics for 100-Lead LQFP_EP

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	17.8	°C/W
θ_{JMA}	Airflow = 1 m/s	15.4	°C/W
θ_{JMA}	Airflow = 2 m/s	14.6	°C/W
θ_{JC}		2.4	°C/W
Ψ_{JT}	Airflow = 0 m/s	0.24	°C/W
Ψ_{JMT}	Airflow = 1 m/s	0.37	°C/W
Ψ_{JMT}	Airflow = 2 m/s	0.51	°C/W

Table 50. Thermal Characteristics for 176-Lead LQFP_EP

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	16.9	°C/W
θ_{JMA}	Airflow = 1 m/s	14.6	°C/W
θ_{JMA}	Airflow = 2 m/s	13.8	°C/W
θ_{JC}		2.3	°C/W
Ψ_{JT}	Airflow = 0 m/s	0.21	°C/W
Ψ_{JMT}	Airflow = 1 m/s	0.32	°C/W
Ψ_{JMT}	Airflow = 2 m/s	0.41	°C/W

Thermal Diode

The ADSP-21486x processors incorporate thermal diode/s to monitor the die temperature. The thermal diode of is a grounded collector, PNP Bipolar Junction Transistor (BJT). The THD_P pin is connected to the emitter and the THD_M pin is connected to the base of the transistor. These pins can be used by an external temperature sensor (such as ADM 1021A or LM86 or others) to read the die temperature of the chip.

The technique used by the external temperature sensor is to measure the change in VBE when the thermal diode is operated at two different currents. This is shown in the following equation:

$$\Delta V_{BE} = n \times \frac{kT}{q} \times \ln(N)$$

where:

n = multiplication factor close to 1, depending on process variations

k = Boltzmann's constant

T = temperature (°C)

q = charge of the electron

N = ratio of the two currents

The two currents are usually in the range of 10 micro Amperes to 300 micro Amperes for the common temperature sensor chips available.

Table 51 contains the thermal diode specifications using the transistor model.

Table 51. Thermal Diode Parameters – Transistor Model

Symbol	Parameter	Min	Typ	Max	Unit
I_{FW}^1	Forward Bias Current	TBD		TBD	μA
I_E	Emitter Current	TBD		TBD	μA
$n_Q^{2,3}$	Transistor Ideality	TBD	TBD	TBD	
$R_T^{3,4}$	Series Resistance	TBD	TBD	TBD	Ω

¹Analog Devices does not recommend operation of the thermal diode under reverse bias.

²Not 100% tested. Specified by design characterization.

³The ideality factor, n_Q , represents the deviation from ideal diode behavior as exemplified by the diode equation:

$$I_C = I_S \times (e^{qV_{BE}/nqkT} - 1)$$

where I_S = saturation current, q = electronic charge, V_{BE} = voltage across the diode, k = Boltzmann Constant, and T = absolute temperature (Kelvin).

⁴The series resistance (R_T) can be used for more accurate readings as needed.

100-LQFP_EP LEAD ASSIGNMENT

Table 52 lists the lead names and their default function after reset (in parentheses).

OUTLINE DIMENSIONS

The ADSP-2148x processors are available in a 100-lead and 176-lead LQFP_EP RoHS compliant packages.

COMPLIANT TO JEDEC STANDARDS MS-026-BED-HD

Figure 53. 100-Lead Low Profile Quad Flat Package, Exposed Pad [LQFP_EP] (SW-100-2)

Dimensions shown in millimeters

COMPLIANT TO JEDEC STANDARDS MS-026-BGA-HD

Figure 54. 176-Lead Low Profile Quad Flat Package, Exposed Pad (LQFP_EP)
(SW-176-2)

Dimensions shown in millimeters

SURFACE-MOUNT DESIGN

The exposed pad is required to be electrically and thermally connected to GND. Implement this by soldering the exposed pad to a GND PCB land that is the same size as the exposed pad.

The GND PCB land should be robustly connected to the GND plane in the PCB for best electrical and thermal performance. No separate GND pins are provided in the package.

AUTOMOTIVE PRODUCTS

The ADSP-21488 and ADSP-21489 models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these Automotive models may have specifications that differ from the commercial models and designers should review the product Specifications section of this datasheet carefully. Only the auto-

otive grade products shown in Table 54 are available for use in Automotive applications. Contact your local ADI account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
