

## TP3051, TP3056 Parallel Interface CODEC/Filter COMBO®

### General Description

The TP3051, TP3056 family consists of a  $\mu$ -law and A-law monolithic PCM CODEC/filter set utilizing the A/D and D/A conversion architecture shown in *Figure 1* and a parallel I/O data bus interface. The devices are fabricated using National's advanced double poly microCMOS process.

The transmit section consists of an input gain adjust amplifier, an active RC pre-filter, and a switched-capacitor band-pass filter that rejects signals below 200 Hz and above 3400 Hz. A compressing coder samples the filtered signal and encodes it in the  $\mu$ -255 law or A-law PCM format. Auto-zero circuitry is included on-chip. The receive section consists of an expanding decoder which reconstructs the analog signal from the compressed  $\mu$ -law or A-law code, and a low pass filter which corrects for the  $\sin x/x$  response of the decoder output and rejects signals above 3400 Hz. The receive output is a single-ended power amplifier capable of driving low impedance loads. The TP3051  $\mu$ -law and TP3056 A-law devices are pin compatible parallel interface COMBOs for bus-oriented systems.

### Features

- Complete CODEC and filtering system including:
  - Transmit high pass and low pass filtering
  - Receive low pass filter with  $\sin x/x$  correction
  - Receive power amplifier
  - Active RC noise filters
  - $\mu$ -255 law COder and DECoder—TP3051
  - A-law COder and DECoder—TP3056
  - Internal precision voltage reference
  - Internal auto-zero circuitry
- Meets or exceeds all LSSGR and CCITT specifications
- $\pm 5V$  operation
- Low operating power—typically 60 mW
- Power-down standby mode—typically 3 mW
- High speed TRI-STATE® data bus
- 2 loopback test modes

### Pin Description

Symbol	Function
V <sub>BB</sub>	Negative power supply pin. V <sub>BB</sub> = -5V ± 5%.
GNDA	Analog ground. All analog signals are referenced to this pin.
V <sub>FR0</sub>	Analog output of the receive power amplifier. This output can drive a 600Ω load to ±2.5V.
V <sub>CCA</sub>	Positive power supply voltage pin for the analog circuitry. V <sub>CCA</sub> = 5V ± 5%. Must be connected to V <sub>CCD</sub> .
$\overline{CS}$	Device chip select input which controls READ, WRITE and TRI-STATE® operations on the data bus. $\overline{CS}$ does not control the state of any analog functions.
DB7	Bit 7 I/O on the data bus. The PCM LSB.
DB6	Bit 6 I/O on the data bus.
DB5	Bit 5 I/O on the data bus.
DB4	Bit 4 I/O on the data bus.
GNDD	Digital ground. All digital signals are referenced to this pin.
DB3	Bit 3 I/O on the data bus.
DB2	Bit 2 I/O on the data bus.
DB1	Bit 1 I/O on the data bus.
DB0	Bit 0 I/O on the data bus. This is the PCM sign bit.
CLK	The clock input for the switched-capacitor filters and CODEC. Clock frequency must be 768 kHz, 772 kHz, 1.024 MHz or 1.28 MHz and must be synchronous with the system clock input.

Symbol	Function
PCM/CNTL	This control input determines whether the information on the data bus is PCM data or control data.
V <sub>CCD</sub>	Positive power supply pin for the bus drivers. V <sub>CCD</sub> = 5V ± 5%. Must be connected to V <sub>CCA</sub> .
GS <sub>x</sub>	Analog output of the transmit input amplifier. Used to externally set gain.
VF <sub>xI</sub> <sup>-</sup>	Inverting input of the transmit input amplifier.
VF <sub>xI</sub> <sup>+</sup>	Non-inverting input of the transmit input amplifier.

### Functional Description

#### CLOCK AND DATA BUS CONTROL

The CLK input signal provides timing for the encode and decode logic and the switched-capacitor filters. It must be one of the frequencies listed in Table I and must be correctly selected by control bits C0 and C1.

CLK also functions as a READ/WRITE control signal, with the device reading the data bus on a positive half-clock cycle and writing the bus on a negative half-clock cycle, as shown in Figures 4a and 4b.

#### POWER-UP

When power is first applied, power-on reset circuitry initializes the COMBO and sets it in the power-down mode. All non-essential circuits are deactivated and the data bus outputs, DB0-DB7, and receive power amplifier output, V<sub>FR0</sub>, are in high impedance states.

The TP3051, TP3056 is powered-up via a command to the control register (see Control Register Functions). This sets

## Functional Description (Continued)

the device in the standby mode with all circuitry activated, but encoding and decoding do not begin until PCM READ and PCM WRITE chip selects occur.

**TABLE I. Control Bit Functions**

Control Bits	Function
C0, C1	Select Clock Frequency
	<b>C0 C1 Frequency</b>
	0 X 1.024 MHz
	1 0 0.768 MHz or 0.772 MHz
1 1 1.28 MHz	
C2, C3	Digital and Analog Loopback
	<b>C2 C3 Mode</b>
	1 X digital loopback
	0 1 analog loopback
0 0 normal	
C4	Power-Down/Power-Up (Note 1)
	1 = power-down 0 = power-up
C5	TP3051—Don't care (Note 1)
	TP3056
	1 = Not implemented. Do not use. 0 = A-law with even bit inversion
C6–C7	Don't Care (Note 1)

**Note 1:** These bits are always set to logical "1" when reading back the control register.

### DATA BUS NOMENCLATURE

The normal order for serial PCM transmission is sign bit first, whereas the normal order for serial data is LSB first. The parallel data bus is defined as follows:

Data Type	DB0	DB7
PCM	Sign Bit	LSB
Control Data	C0	C7

### READING THE BUS

If CLK is low when  $\overline{CS}$  goes low, bus data is gated in during the next positive half-clock cycle of CLK and latched on the negative-going transition. If  $\overline{PCM/CNTL}$  is low during the falling  $\overline{CS}$  transition, then the bus data is defined as PCM voice data, which is latched into the receive register. This also functions as an internal receive frame synchronization pulse to start a decode cycle and must occur once per receive frame, i.e., at an 8 kHz rate.

If  $\overline{PCM/CNTL}$  is high during the falling  $\overline{CS}$  transition, the bus data is latched into the control register. This does not affect frame synchronization.

### WRITING THE BUS

If CLK is high when  $\overline{CS}$  goes low, at the next falling transition of CLK, the bus drivers are enabled and either the PCM transmit data or the contents of the control register are gated onto the bus, depending on the level of  $\overline{PCM/CNTL}$  at the  $\overline{CS}$  transition. If  $\overline{PCM/CNTL}$  is low during the  $\overline{CS}$  falling transition, the transmit register data is written to the bus.

An internal transmit frame synchronization pulse is also generated to start an encode cycle, and this must occur once per transmit frame; i.e., at an 8 kHz rate.

If  $\overline{PCM/CNTL}$  is high during the  $\overline{CS}$  falling transition, the control register data is written to the bus. This does not affect frame synchronization.

The receive register contents may also be written back to the bus, as described in the Digital Loopback section.

Except during a WRITE cycle, the bus drivers are in TRI-STATE mode.

### CONTROL REGISTER FUNCTIONS

Writing to the control register allows the user to set the various operating states of the TP3051 and TP3056. The control register can also be read back via the data bus to verify the current operating mode of the device.

#### 1. CLK Select

Since one of three distinct clock frequencies may be used, the actual frequency must be known by the device for proper operation of the switched-capacitor filters. This is achieved by writing control register bits C0 and C1, normally in the same WRITE cycle that powers-up the device, and before any PCM data transfers take place.

#### 2. Digital Loopback

In order to establish that a valid path has been selected through a network, it is sometimes desirable to be able to send data through the network to its destination, then loop it back through the network return path to the originating source where the data can be verified. This loopback function can be performed in the TP3051 or TP3056 by setting control register bit C2 to 1. With C2 set, the PCM data in the receive register will be written back onto the data bus during the next PCM WRITE cycle. In the digital loopback mode, the receive section is set to an idle channel condition in order to maintain a low impedance termination at  $V_{FQ}$ .

#### 3. Analog Loopback

In the analog loopback mode, the transmit filter input is switched from the gain adjust amplifier to the receive power amplifier output, forming a unity-gain loop from the receive register back to the transmit register. This mode is entered by setting control register bits C2 to 0 and C3 to 1. The receive power amplifier continues to drive the load in this mode.

#### 4. Power-Down/Power-Up

The TP3051 or TP3056 may be put in the power-down mode by setting control register bit C4 to 1. Conversely, setting bit C4 to 0 powers-up the device.

### TRANSMIT FILTER AND ENCODE SECTION

The transmit section input is an operational amplifier with provision for gain adjustment using two external resistors, see Figure 2. The low noise and wide bandwidth allow gains in excess of 20 dB across the audio passband to be realized. The op amp drives a unity-gain filter consisting of a 2nd order RC active pre-filter, followed by an 8th order switched-capacitor bandpass filter clocked at 256 kHz. The output of this filter directly drives the encoder sample-and-hold circuit. The A/D is of companding type according to  $\mu$ -255 law (TP3051) or A-law (TP3056) coding schemes. A precision voltage reference is trimmed in manufacturing

## Functional Description (Continued)

to provide an input overload ( $t_{MAX}$ ) of nominally 2.5V peak (see table of Transmission Characteristics). Any offset voltage due to the filters or comparator is cancelled by sign bit integration in the auto-zero circuit.

The total encoding delay referenced to a PCM WRITE chip select will be approximately 165  $\mu$ s (due to the transmit filter) plus 125  $\mu$ s (due to encoding delay), which totals 290  $\mu$ s.

### DECODER AND RECEIVE FILTER SECTION

The receive section consists of an expanding DAC which drives a 5th order switched-capacitor low pass filter clocked

at 256 kHz. The decoder is of A-law (TP3056) or  $\mu$ -law (TP3051) coding law and the 5th order low pass filter corrects for the  $\sin x/x$  attenuation due to the 8 kHz sample/hold. The filter is then followed by a 2nd order RC active post-filter. The power amplifier output stage is capable of driving a 600 $\Omega$  load to a level of 7.2 dBm. See *Figure 3*. The receive section has unity-gain. Following a PCM READ chip select, the decoding cycle begins, and 10  $\mu$ s later the decoder DAC output is updated. The total decoder delay is  $\sim$  10  $\mu$ s (decoder update) plus 110  $\mu$ s (filter delay) plus 62.5  $\mu$ s ( $1/2$  frame), which gives approximately 180  $\mu$ s.

TL/H/8834-4

$$\text{Non-inverting transmit gain} = 20 \log_{10} \left( \frac{R1 + R2}{R2} \right)$$

Set gain to provide peak overload level =  $t_{MAX}$  at  $GS_x$  (see Transmission Characteristics)

**FIGURE 2. Transmit Gain Adjustment**

Maximum output power = 7.2 dBm total, 4.2 dBm to the load.

TL/H/8834-5

See Applications information for attenuator design guide.

**FIGURE 3. Receive Gain Adjustment**

## Absolute Maximum Ratings

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

GNDD to GNDA	±0.3V
V <sub>CCA</sub> or V <sub>CCD</sub> to GNDD or GNDA	7V
V <sub>BB</sub> to GNDD or GNDA	-7V
Voltage at Any Analog Input or Output	V <sub>CC</sub> + 0.3V to V <sub>BB</sub> - 0.3V

Voltage at Any Digital Input or Output	V <sub>CC</sub> + 0.3V to GNDD - 0.3V
Operating Temperature Range	-25°C to +125°C
Storage Temperature Range	-65°C to +150°C
Lead Temp. (Soldering, 10 sec.)	300°C
ESD (Human Body Model)	1000V

## Electrical Characteristics

Unless otherwise noted: V<sub>CCA</sub> = V<sub>CCD</sub> = 5.0V ± 5%, V<sub>BB</sub> = -5V ± 5%, GNDD = GNDA = 0V, T<sub>A</sub> = 0°C to 70°C; typical characteristics specified at nominal supply voltages, T<sub>A</sub> = 25°C; all digital signals are referenced to GNDD, all analog signals are referenced to GNDA. Limits printed in **BOLD** characters are guaranteed for V<sub>CCA</sub> = V<sub>CCD</sub> = 5.0V ± 5% and V<sub>BB</sub> = -5.0V ± 5%; T<sub>A</sub> = 0°C to 70°C by correlation with 100% Electrical testing at T<sub>A</sub> = 25°C. All other limits are assured by correlation with other production test and/or product design and characteristics.

### Transmission Characteristics (Continued)

Unless otherwise specified:  $T_A = 0^\circ\text{C}$  to  $+70^\circ\text{C}$ ,  $V_{CCA} = V_{CCD} = 5\text{V} \pm 5\%$ ,  $V_{BB} = -5\text{V} \pm 5\%$ ,  $G_{NDD} = G_{NDA} = 0\text{V}$ ,  $f = 1.02\text{ kHz}$ ,  $V_{IN} = 0\text{ dBm0}$ , transmit input amplifier connected for unity-gain non-inverting. Limits printed in **BOLD** characters are guaranteed for  $V_{CCA} = V_{CCD} = 5.0\text{V} \pm 5\%$  and  $V_{BB} = -5.0\text{V} \pm 5\%$ ;  $T_A = 0^\circ\text{C}$  to  $70^\circ\text{C}$  by correlation with 100% electrical testing at  $T_A = 25^\circ\text{C}$ . All other limits are assured by correlation with other production tests and/or product design and characteristics.

Symbol	Parameter	Conditions	Min	Typ	Max	Units

# Applications Information

## POWER SUPPLIES

While the pins of the TP3051/6 family are well protected against electrical misuse, it is recommended that the standard CMOS practice be followed, ensuring that ground is connected to the device before any other connections are made. In applications where the printed circuit board may be plugged into a "hot" socket with power and clocks already present, an extra long ground pin in the connector should be used. GNDA and GNDD MUST be connected together adjacent to each COMBO not on the connector or back-plane wiring.

All ground connections to each device should meet at a common point as close as possible to the GNDA pin. This minimizes the interaction of ground return currents flowing through a common bus impedance. 0.1 μF supply decoupling capacitors should be connected from this common ground point to V<sub>CCA</sub> and V<sub>BB</sub>.

For best performance, the ground point of each COMBO on a card should be connected to a common card ground in star formation, rather than via a ground bus. This common ground point should be decoupled to V<sub>CC</sub> and V<sub>BB</sub> with 10 μF capacitors.

The positive power supply to the bus drivers, V<sub>CCD</sub>, is provided on a separate pin from the positive supply for the CODEC and filter circuits to minimize noise injection when driving the bus. V<sub>CCA</sub> and V<sub>CCD</sub> MUST be connected together close to the CODEC/filter at the point where the 0.1 μF decoupling capacitor is connected.

## RECEIVE GAIN ADJUSTMENT

For applications where a TP3050 family COMBO receive output must drive a 600Ω load, but a peak swing lower than ±2.5V is required, the receive gain can be easily adjusted by inserting a matched T-pad or π-pad at the output. (See Figure 5.) Table II lists the required resistor values for 600Ω terminations. As these are generally non-standard values, the equations can be used to compute the attenuation of the closer practical set of resistors. It may be necessary to use unequal values for the R1 or R4 arms of the attenuators to achieve a precise attenuation. Generally it is tolerable to allow a small deviation of the input impedance from nominal while still maintaining a good return loss. For example a 30 dB return loss against 600Ω is obtained if the output impedance of the attenuator is in the range 282Ω to 319Ω (assuming a perfect transformer).

$$R1 = Z1 \left( \frac{N^2 + 1}{N^2 - 1} \right) - 2\sqrt{Z1Z2} \left( \frac{N}{N^2 - 1} \right)$$

$$R2 = 2\sqrt{Z1Z2} \left( \frac{N}{N^2 - 1} \right)$$

Where:  $N = \sqrt{\frac{\text{POWER IN}}{\text{POWER OUT}}}$

and

$$S = \sqrt{\frac{Z1}{Z2}}$$

Also:  $Z = \sqrt{Z_{SC} Z_{OC}}$

Where Z<sub>SC</sub> = Impedance with short circuit termination

and Z<sub>OC</sub> = Impedance with open circuit termination

$$R3 = \sqrt{\frac{Z1Z2}{2}} \left( \frac{N^2 - 1}{N} \right)$$

$$R4 = Z1 \left( \frac{N^2 - 1}{N^2 - 2NS + 1} \right)$$

TABLE II. Attenuator Tables for Z<sub>1</sub> = Z<sub>2</sub> = 300Ω (All Values in Ω)

dB	R1	R2	R3	R4
0.1	1.7	26k	3.5	52k
0.2	3.5	13k	6.9	26k
