

# TP3076 COMBO® II Programmable PCM CODEC/Filter for ISDN and Digital Phone Applications

## General Description

The TP3076 is a second-generation combined PCM CODEC and Filter devices optimized for digital switching applications on subscriber line and trunk cards and digital phone applications. Using advanced switched capacitor techniques, COMBO II combines transmit bandpass and receive low-pass channel filters with a companding PCM encoder and decoder. The devices are A-law and  $\mu$ -law selectable and employ a conventional serial PCM interface capable of being clocked up to 4.096 MHz. A number of programmable functions may be controlled via a serial control port.

Channel gains are programmable over a 25.4 dB range in each direction.

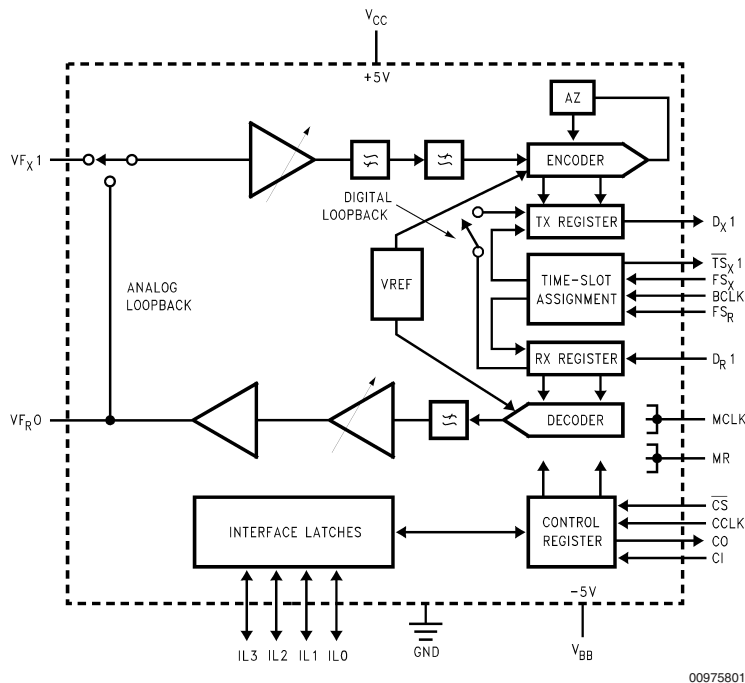

To enable COMBO II to interface to the SLIC control leads, a number of programmable latches are included; each may be configured as either an input or an output. The TP3076 provides 4 latches.

## Features

- Complete CODEC and Filter system including:
  - Transmit and receive PCM channel filters
  - $\mu$ -law or A-law companding coder and decoder
  - Receive power amplifier drives 300 $\Omega$
  - 4.096 MHz serial PCM data (max)
- Programmable functions:
  - Transmit gain: 25.4 dB range, 0.1 dB steps
  - Receive gain: 25.4 dB range, 0.1 dB steps
  - Time-slot assignment; to 64 slots/frame
  - 4 interface latches
  - A or  $\mu$ -law
  - Analog loopback
  - Digital loopback
- Direct interface to solid-state SLICs
- Standard serial control interface
- 80 mW operating power (typ)
- 1.5 mW standby power (typ)
- Designed for CCITT and LSSGR specifications
- TTL and CMOS compatible digital interfaces

**Note:** See also AN-614 COMBO II application guide.

## Pin Descriptions

Pin	Description
V <sub>CC</sub>	+5V ±5% power supply.
V <sub>BB</sub>	-5V ±5% power supply.
GND	Ground. All analog and digital signals are referenced to this pin.
FS <sub>X</sub>	Transmit Frame Sync input. Normally a pulse or squarewave with an 8 kHz repetition rate is applied to this input to define the start of the transmit time slot assigned to this device (non-delayed data timing mode), or the start of the transmit frame (delayed data timing mode using the internal time-slot assignment counter).
FS <sub>R</sub>	Receive Frame Sync input. Normally a pulse or squarewave with an 8 kHz repetition rate is applied to this input to define the start of the receive time slot assigned to this device (non-delayed data timing mode), or the start of the receive frame (delayed data timing mode using the internal time-slot assignment counter).
BCLK	Bit clock input used to shift PCM data into and out of the D <sub>R</sub> and D <sub>X</sub> pins. BCLK may vary from 64 kHz to 4.096 MHz in 8 kHz increments, and must be synchronous with MCLK.
MCLK	Master clock input used by the switched capacitor filters and the encoder and decoder sequencing logic. Must be 512 kHz, 1.536/1.544 MHz, 2.048 MHz or 4.096 MHz and synchronous with BCLK.
V <sub>FXI</sub>	The Transmit analog high-impedance input. Voice frequency signals present on this input are encoded as an A-law or μ-law PCM bit stream and shifted out on the selected D <sub>X</sub> pin.
V <sub>FR0</sub>	The Receive analog power amplifier output, capable of driving load impedances as low as 300Ω (depending on the peak overload level required). PCM data received on the assigned D <sub>R</sub> pin is decoded and appears at this output as voice frequency signals.
D <sub>X1</sub>	This transmit data TRI-STATE® output remains in the high impedance state except during the assigned transmit time slot on the assigned port, during which the transmit PCM data byte is shifted out on the rising edges of BCLK.
$\overline{TS}_X1$	Normally this open drain output is floating in a high impedance state except when a time-slot is active on the D <sub>X</sub> output, when the $\overline{TS}_X1$ output pulls low to enable a backplane line-driver.
D <sub>R1</sub>	This receive data input is inactive except during the assigned receive time slot of the assigned port when the receive PCM data is shifted in on the falling edges of BCLK.
CCLK	Control Clock input. This clock shifts serial control information into CI or out from CO when the $\overline{CS}$ input is low, depending on the current instruction. CCLK may be asynchronous with the other system clocks.
CI	Control Data Input pin. Serial control information is shifted into COMBO II on this pin when $\overline{CS}$ is low. Byte 1 of control information is always written into COMBO II, while the direction of byte 2 data is determined by bit 2 of byte 1, as defined in <i>Table 1</i>
CO	Control Data Output pin. Serial control or status information is shifted out of COMBO II on this pin when $\overline{CS}$ is low.

## Pin Descriptions (Continued)

Pin	Description
$\overline{\text{CS}}$	Chip Select input. When this pin is low, control information can be written to or read from COMBO II via CI or CO.
IL3–IL0	Each Interface Latch I/O pin may be individually programmed as an input or an output determined by the state of the corresponding bit in the Latch Direction Register (LDR). For pins configured as inputs, the logic state sensed on each input is latched into the Interface Latch Register (ILR) whenever control data is written to COMBO II, while $\overline{\text{CS}}$ is low, and the information is shifted out on the CO pin. When configured as outputs, control data written into the ILR appears at the corresponding IL pins.

## Functional Description

### POWER-ON INITIALIZATION

When power is first applied, power-on reset circuitry initializes the COMBO II and puts it into the power-down state. The gain control registers for the transmit and receive gain sections are programmed for no output, the power amp is disabled and the device is in the non-delayed timing mode. The Latch Direction Register (LDR) is pre-set with all IL pins programmed as inputs, placing the SLIC interface pins in a high impedance state. The CO pin is in TRI-STATE condition. Other initial states in the Control Register are indicated in Section 2.0.

The desired modes for all programmable functions may be initialized via the control port prior to a Power-up command.

### POWER-DOWN STATE

Following a period of activity in the powered-up state the power-down state may be re-entered by writing any of the control instructions into the serial control port with the "P" bit set to "1" as indicated in Table 1. It is recommended that the chip be powered down before writing any additional instructions. In the power-down state, all non-essential circuitry is de-activated and the  $D_{x1}$  output is in the high impedance TRI-STATE condition.

The data stored in the Gain Control registers, the LDR and ILR, and all control bits remain unchanged in the power-down state unless changed by writing new data via the serial control port, which remains active. The outputs of the Interface Latches also remain active, maintaining the ability to monitor and control the SLIC.

### TRANSMIT FILTER AND ENCODER

The Transmit section input,  $V_{F_{x1}}$ , is a high impedance input. No external components are necessary to set the gain. Following this is a programmable gain/attenuation amplifier

which is controlled by the contents of the Transmit Gain Register (see Programmable Functions section). An active pre-filter then precedes the 3rd order high-pass and 5th order low-pass switched capacitor filters. The A/D converter has a compressing characteristic according to the standard CCITT A or  $\mu 255$  coding laws, which must be selected by a control instruction during initialization (see Table 1 and Table 2). A precision on-chip voltage reference ensures accurate and highly stable transmission levels. Any offset voltage arising in the gain-set amplifier, the filters or the comparator is canceled by an internal auto-zero circuit.

Each encode cycle begins immediately following the assigned Transmit time-slot. The total signal delay referenced to the start of the time-slot is approximately 165  $\mu\text{s}$  (due to the Transmit Filter) plus 125  $\mu\text{s}$  (due to encoding delay), which totals 290  $\mu\text{s}$ . Data is shifted out on  $D_{x1}$  during the selected time slot on eight rising edges of BCLK.

### DECODER AND RECEIVER FILTER

PCM data is shifted into the Decoder's Receive PCM Register via the  $D_{R1}$  pin during the selected time-slot on the 8 falling edges of BCLK. The Decoder consists of an expanding DAC with either A or  $\mu 255$  law decoding characteristic, which is selected by the same control instruction used to select the Encode law during initialization. Following the Decoder is a 5th order low-pass switched capacitor filter with integral  $\text{Sin } x/x$  correction for the 8 kHz sample and hold. A programmable gain amplifier, which must be set by writing to the Receive Gain Register, is included, and finally a Power Amplifier capable of driving a 300 $\Omega$  load to  $\pm 3.5\text{V}$ , a 600 $\Omega$  load to  $\pm 3.8\text{V}$  or a 15 k $\Omega$  load to  $\pm 4.0\text{V}$  at peak overload.

TABLE 1. Programmable Register Instructions

Function	Byte 1 (Notes 1, 2, 3)								Byte 2 (Note 1)							
	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Single Byte Power-Up/Down	P	X	X	X	X	X	0	X	None							
Write Control Register	P	0	0	0	0	0	1	X	See Table 2							
Read-Back Control Register	P	0	0	0	0	1	1	X	See Table 2							
Write to Interface Latch Register	P	0	0	0	1	0	1	X	See Table 4							
Read Interface Latch Register	P	0	0	0	1	1	1	X	See Table 4							
Write Latch Direction Register	P	0	0	1	0	0	1	X	See Table 3							
Read Latch Direction Register	P	0	0	1	0	1	1	X	See Table 3							
Write Receive Gain Register	P	0	1	0	0	0	1	X	See Table 8							
Read Receive Gain Register	P	0	1	0	0	1	1	X	See Table 8							

## Functional Description (Continued)

**TABLE 1. Programmable Register Instructions (Continued)**

Function	Byte 1 (Notes 1, 2, 3)								Byte 2 (Note 1)							
	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Write Transmit Gain Register	P	0	1	0	1	0	1	X	See Table 7							
Read Transmit Gain Register	P	0	1	0	1	1	1	X	See Table 7							
Write Receive Time-Slot/Port	P	1	0	0	1	0	1	X	See Table 6							
Read-Back Receive Time-Slot/Port	P	1	0	0	1	1	1	X	See Table 6							
Write Transmit Time-Slot/Port	P	1	0	1	0	0	1	X	See Table 6							
Read-Back Transmit Time-Slot/Port	P	1	0	1	0	1	1	X	See Table 6							

**Note 1:** Bit 7 of bytes 1 and 2 is always the first bit clocked into or out from the CI or CO pin. X = don't care.

**Note 2:** "P" is the power-up/down control bit, see Power-up/Down Control section. ("0" = Power Up, "1" = Power Down)

**Note 3:** Other register address codes are invalid and should not be used.

A decode cycle begins immediately after the assigned receive timeslot, and 10  $\mu$ s later the Decoder DAC output is updated. The total signal delay is 10  $\mu$ s plus 120  $\mu$ s (filter delay) plus 62.5  $\mu$ s ( $\frac{1}{2}$  frame) which gives approximately 190  $\mu$ s.

### PCM INTERFACE

The FS<sub>X</sub> and FS<sub>R</sub> frame sync inputs determine the beginning of the 8-bit transmit and receive time-slots respectively. They may have any duration from a single cycle of BCLK HIGH to one MCLK period LOW. Two different relationships may be established between the frame sync inputs and the actual time-slots on the PCM busses by setting bit 3 in the Control Register (see Table 2). Non-delayed data mode is similar to long-frame timing on the TP3050/60 series of devices (COMBO); time-slots begin nominally coincident with the rising edge of the appropriate FS input. The alternative is to use Delayed Data mode, which is similar to shortframe sync timing on COMBO, in which each FS input must be high at least a half-cycle of BCLK earlier than the timeslot. The Time-Slot Assignment circuit on the device can only be used with Delayed Data timing.

When using Time-Slot Assignment, the beginning of the first time-slot in a frame is identified by the appropriate FS input. The actual transmit and receive time-slots are then determined by the internal Time-Slot Assignment counters.

Transmit and Receive frames and time-slots may be skewed from each other by any number of BCLK cycles. During each assigned Transmit time-slot, the D<sub>X</sub>1 output shifts data out from the PCM register on the rising edges of BCLK.  $\overline{TS}_X1$  also pulls low for the first  $7\frac{1}{2}$  bit times of the time-slot to control the TRI-STATE Enable of a backplane line-driver. Serial PCM data is shifted into the D<sub>R</sub>1 input during each assigned Receive time-slot on the falling edges of BCLK.

### SERIAL CONTROL PORT

Control information and data are written into or read-back from COMBO II via the serial control port consisting of the control clock CCLK, the serial data input, CI, and output, CO, and the Chip Select input,  $\overline{CS}$ . All control instructions require 2 bytes, as listed Table 1, with the exception of a single byte power-up/down command. The Byte 1 bits are used as follows: bit 7 specifies power up or power down; bits 6, 5, 4 and 3 specify the register address, bit 2 specifies whether the instruction is read or write; bit 1 specifies a one or two byte instruction; and bit 0 is not used.

To shift control data into COMBO II, CCLK must be pulsed high 8 times while  $\overline{CS}$  is low. Data on the CI input is shifted

into the serial input register on the falling edge of each CCLK pulse. After all data is shifted in, the contents of the input shift register are decoded, and may indicate that a 2nd byte of control data will follow. This second byte may either be defined by a second byte-wide  $\overline{CS}$  pulse or may follow the first contiguously, i.e. it is not mandatory for  $\overline{CS}$  to return high between the first and second control bytes. At the end of CCLK8 in the 2nd control byte the data is loaded into the appropriate programmable register.  $\overline{CS}$  may remain low continuously when programming successive registers, if desired. However,  $\overline{CS}$  must be set high when no data transfers are in progress.

To readback Interface Latch data or status information from COMBO II, the first byte of the appropriate instruction is strobed while  $\overline{CS}$  is low, as defined in Table 1.  $\overline{CS}$  must be kept low, or be taken low again for a further 8 CCLK cycles, during which the data is shifted onto the CO pin on the rising edges of CCLK. When  $\overline{CS}$  is high the CO pin is in the high-impedance TRI-STATE, enabling the CI and CO pins of many devices to be multiplexed together.

If  $\overline{CS}$  returns high during either byte 1 or byte 2 before all eight CCLK pulses of that byte occur, both the bit count and byte count are reset and register contents are not affected. This prevents loss of synchronization in the control interface as well as corruption of register data due to processor interrupt or other problem. When  $\overline{CS}$  returns low again, the device will be ready to accept bit 1 of byte 1 of a new instruction.

## Programmable Functions

### POWER-UP/DOWN CONTROL

Following power-on initialization, power-up and power-down control may be accomplished by writing any of the control instructions listed in Table 1 into COMBO II with the "P" bit set to "0" for power-up or "1" for power-down. Normally it is recommended that all programmable functions be initially programmed while the device is powered down. Power state control can then be included with the last programming instruction or the separate single-byte instruction. Any of the programmable registers may also be modified while the device is powered-up or down by setting the "P" bit as indicated. When the power-up or down control is entered as a single byte instruction, bit one (1) must be reset to a 0.

When a power-up command is given, all de-activated circuits are activated, but the TRI-STATE PCM output(s), D<sub>X</sub>1 will remain in the high impedance state until the second FS<sub>X</sub> pulse after power-up.

# Programmable Functions (Continued)

## CONTROL REGISTER INSTRUCTION

The first byte of a READ or WRITE instruction to the Control Register is as shown in *Table 1*. The second byte has the following bit functions:

**TABLE 2. Control Register Byte 2 Functions**

Bit Number and Name								Function
7	6	5	4	3	2	1	0	
F <sub>1</sub>	F <sub>0</sub>	MA	IA	DN	DL	AL	PP	
0	0							MCLK = 512 kHz
0	1							MCLK = 1.536 MHz or 1.544 MHz
1	0							MCLK = 2.048 MHz (Note 4)
1	1							MCLK = 4.096 MHz
		0	X					Select $\mu$ 255 Law (Note 4)
		1	0					A-Law, Including Even Bit Inversion
		1	1					A-Law, No Even Bit Inversion
				0				Delay Data Timing Non-Delayed
				1				Data Timing (Note 4)
					0	0		Normal Operation (Note 4)
					1	X		Digital Loopback
					0	1		Analog Loopback
							0	Power Amp Enabled in PDN
							1	Power Amp Disabled in PDN (Note 4)

**Note 4:** state at power-on initialization.

### Master Clock Frequency Selection

A Master clock must be provided to COMBO II for operation of the filter and coding/decoding functions. The MCLK frequency must be either 512 kHz, 1.536 MHz, 1.544 MHz, 2.048 MHz, or 4.096 MHz and must be synchronous with BCLK. Bits F<sub>1</sub> and F<sub>0</sub> (see *Table 2*) must be set during initialization to select the correct internal divider.

### Coding Law Selection

Bits "MA" and "IA" in *Table 2* permit the selection of  $\mu$ 255 coding or A-law coding, with or without even bit inversion.

### Analog Loopback

Analog Loopback mode is entered by setting the "AL" and "DL" bits in the Control Register as shown in *Table 2*. In the analog loopback mode, the Transmit input VF<sub>XI</sub> is isolated

from the input pin and internally connected to the VF<sub>RO</sub> output, forming a loop from the Receive PCM Register back to the Transmit PCM Register. The VF<sub>RO</sub> pin remains active, and the programmed settings of the Transmit and Receive gains remain unchanged, thus care must be taken to ensure that overload levels are not exceeded anywhere in the loop.

### Digital Loopback

Digital Loopback mode is entered by setting the "AL" and "DL" bits in the Control Register as shown in *Table 2*. This mode provides another stage of path verification by enabling data written into the Receive PCM Register to be read back from that register in any Transmit time-slot at D<sub>X1</sub>. PCM decoding continues and analog output appears at VF<sub>RO</sub>. The output can be disabled by programming 'No Output' in the Receive Gain Register (see *Table 8*).

### INTERFACE LATCH DIRECTIONS

Immediately following power-on, all Interface Latches assume they are inputs, and therefore all IL pins are in a high impedance state. Each IL pin may be individually programmed as a logic input or output by writing the appropriate instruction to the LDR, see *Table 1* and *Table 3*. For minimum power dissipation, unconnected latch pins should be programmed as outputs. For the TP3076, bits 2 and 3 should always be programmed as "1" (outputs).

Bits L<sub>3</sub>-L<sub>0</sub> must be set by writing the specific instruction to the LDR with the L bits in the second byte set as follows:

**TABLE 3. Byte 2 Functions of Latch Direction Register**

Byte 2 Bit Number							
7	6	5	4	3	2	1	0
L <sub>0</sub>	L <sub>1</sub>	L <sub>2</sub>	L <sub>3</sub>	1	1	X	X
L <sub>n</sub> Bit				IL Direction			
0				Input			
1				Output			

X = Don't Care

### INTERFACE LATCH STATES

Interface Latches configured as outputs assume the state determined by the appropriate data bit in the 2-byte instruction written to the Interface Latch Register (ILR) as shown in *Table 1* and *Table 4*. Latches configured as inputs will sense the state applied by an external source, such as the Off-Hook detect output of a SLIC. All bits of the ILR, i.e. sensed inputs and the programmed state of outputs, can be read back in the 2nd byte of a READ from the ILR.

It is recommended that during initialization, the state of IL pins to be configured as outputs should be programmed first followed immediately by the Latch Direction Register.

**TABLE 4. Interface Latch Data Bit Order**

Bit Number							
7	6	5	4	3	2	1	0
D <sub>0</sub>	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	D <sub>5</sub>	X	X

## Programmable Functions (Continued)

**TABLE 5. Coding Law Conventions**

	$\mu$ 255 Law		True A-Law with Even Bit Inversion		A-Law without Even Bit Inversion	
	MSB	LSB	MSB	LSB	MSB	LSB
$V_{IN} = +\text{Full Scale}$	1	0000000	1	0101010	1	1111111
$V_{IN} = 0V$	1	1111111	1	1010101	1	0000000
	1	1111111	0	1010101	0	0000000
$V_{IN} = -\text{Full Scale}$	0	0000000	0	0101010	0	1111111

**Note 5:** The MSB is always the first PCM bit shifted in or out of COMBO II.

**TABLE 6. Time-Slot and Port Assignment Instruction**

Bit Number and Name								Function
7	6	5	4	3	2	1	0	
EN	PS (Note 6)	T <sub>5</sub> (Note 7)	T <sub>4</sub>	T <sub>3</sub>	T <sub>2</sub>	T <sub>1</sub>	T <sub>0</sub>	
0	1	X	X	X	X	X	X	Disable D <sub>X</sub> 1 Output (Transmit Instruction) Disable D <sub>R</sub> 1 Input (Receive Instruction)
1	1	Assign One Binary Coded Time-Slot from 0–63 Assign One Binary Coded Time-Slot from 0–63						Enable D <sub>X</sub> 1 Output (Transmit Instruction) Enable D <sub>R</sub> 1 Input (Transmit Instruction)

**Note 6:** The “PS” bit MUST be set to “1” for both transmit and receive for the TP3076.

**Note 7:** T<sub>5</sub> is the MSB of the time-slot assignment bit field. Time-slot bits should be set to “000000” for both transmit and receive when operating in non-delayed data timing mode.

### TIME-SLOT ASSIGNMENT

COMBO II can operate in either fixed time-slot or time-slot assignment mode for selecting the Transmit and Receive PCM time-slots. Following power-on, the device is automatically in Non-Delayed Timing mode, in which the time-slot always begins with the leading (rising) edge of frame sync inputs FS<sub>X</sub> and FS<sub>R</sub>. Time-Slot Assignment may only be used with Delay Data timing; see *Figure 3*. FS<sub>X</sub> and FS<sub>R</sub> may have any phase relationship with each other in BCLK period increments.

Alternatively, the internal time-slot assignment counters and comparators can be used to access any time-slot in a frame, using the frame sync inputs as marker pulses for the beginning of transmit and receive time-slot 0. In this mode, a frame may consist of up to 64 time-slots of 8 bits each. A time-slot is assigned by a 2-byte instruction as shown in *Table 1* and *Table 6*. The last 6 bits of the second byte indicate the selected time-slot from 0–63 using straight binary notation. When writing a time-slot and port assignment register, if the PCM interface is currently active, it is immediately deactivated to prevent possible bus clashes. A new assignment becomes active on the second frame following the end of the Chip-Select for the second control byte. Rewriting of the register contents should not be performed during the talking period of a connection to prevent waveform distortion caused by loss of a sample which will occur with each register write. The “EN” bit allows the PCM input, D<sub>R</sub>1, or output, D<sub>X</sub>1, as appropriate, to be enabled or disabled.

Time-Slot Assignment mode requires that the FS<sub>X</sub> and FS<sub>R</sub> pulses conform to the delayed data timing format shown in *Figure 3*.

### PORT SELECTION

On the TP3076, the “PS” bit MUST always be set to 1.

*Table 6* shows the format for the second byte of both transmit and receive time-slot and port assignment instructions.

### TRANSMIT GAIN INSTRUCTION BYTE 2

The transmit gain can be programmed in 0.1 dB steps by writing to the Transmit Gain Register as defined in *Table 1* and *Table 7*. This corresponds to a range of 0 dBm0 levels at VF<sub>XI</sub> between 1.375 Vrms and 0.074 Vrms (equivalent to +5.0 dBm to –20.4 dBm in 600Ω).

To calculate the binary code for byte 2 of this instruction for any desired input 0 dBm0 level in Vrms, take the nearest integer to the decimal number given by:

$$200 \times \log_{10} (V/0.07299)$$

and convert to the binary equivalent. Some examples are given in *Table 7*. A complete tabulation is given in Appendix I of AN-614.

It should be noted that the Transmit (idle channel) Noise and Transmit Signal to Total Distortion are both specified with transmit gain set to 0 dB (gain register set to all ones). At high transmit gains there will be some degradation in noise performance for these parameters. See Application Note AN-614 for more information on this subject.

**TABLE 7. Byte 2 of Transmit Gain Instruction**

Bit Number 7 6 5 4 3 2 1 0	0 dBm0 Test Level (Vrms) at VF <sub>XI</sub>
0 0 0 0 0 0 0 0	No Output (Note 8)
0 0 0 0 0 0 0 1	0.074
0 0 0 0 0 0 1 0	0.075
—	—
1 1 1 1 1 1 1 0	1.359

## Programmable Functions (Continued)

**TABLE 7. Byte 2 of Transmit Gain Instruction (Continued)**

Bit Number 7 6 5 4 3 2 1 0	0 dBm0 Test Level (Vrms) at VF <sub>XI</sub>
1 1 1 1 1 1 1 1	1.375

**Note 8:** Analog signal path is cut off, but D<sub>X</sub> remains active and will output codes representing idle noise.

### RECEIVE GAIN INSTRUCTION BYTE 2

The receive gain can be programmed in 0.1 dB steps by writing to the Receive Gain Register as defined in *Table 1* and *Table 8*. Note the following restrictions on output drive capability:

- 0 dBm0 levels  $\leq 1.96$  Vrms at VF<sub>RO</sub> may be driven into a load of  $\geq 15$  k $\Omega$  to GND; Receive Gain set to 0 dB (gain register set to all ones).
- 0 dBm0 levels  $\leq 1.85$  Vrms at VF<sub>RO</sub> may be driven into a load of  $\geq 600\Omega$  to GND; Receive Gain set to 0.5 dB.
- 0 dBm0 levels  $\leq 1.71$  Vrms at VF<sub>RO</sub> may be driven into a load of  $\geq 300\Omega$  to GND. Receive Gain set to -1.2 dB.

To calculate the binary code for byte 2 of this instruction for any desired output 0 dBm0 level in Vrms, take the nearest integer to the decimal number given by:

$$200 \times \log_{10} (V/0.1043)$$

and convert to the binary equivalent. Some examples are given in *Table 8*. A complete tabulation is given in Appendix I or AN-614.

**TABLE 8. Byte 2 of Receive Gain Instruction**

Bit Number 7 6 5 4 3 2 1 0	0 dBm0 Test Level (Vrms) at VF <sub>RO</sub>
0 0 0 0 0 0 0 0	No Output (Low Z to GND)
0 0 0 0 0 0 0 1	0.105

Bit Number 7 6 5 4 3 2 1 0	0 dBm0 Test Level (Vrms) at VF <sub>RO</sub>
0 0 0 0 0 0 1 0	0.107
—	—
1 1 1 1 1 1 1 0	1.941
1 1 1 1 1 1 1 1	1.964

## Applications Information

*Figure 1* shows a typical ISDN phone application of the TP3076 together with a TP3420 ISDN Transceiver "S" Interface Device and HPC16400 High-Performance Microcontroller with HDLC Controller. The TP3076 device is programmed over its serial control interface via the HPC16400 MICROWIRE/PLUS™ serial I/O port.

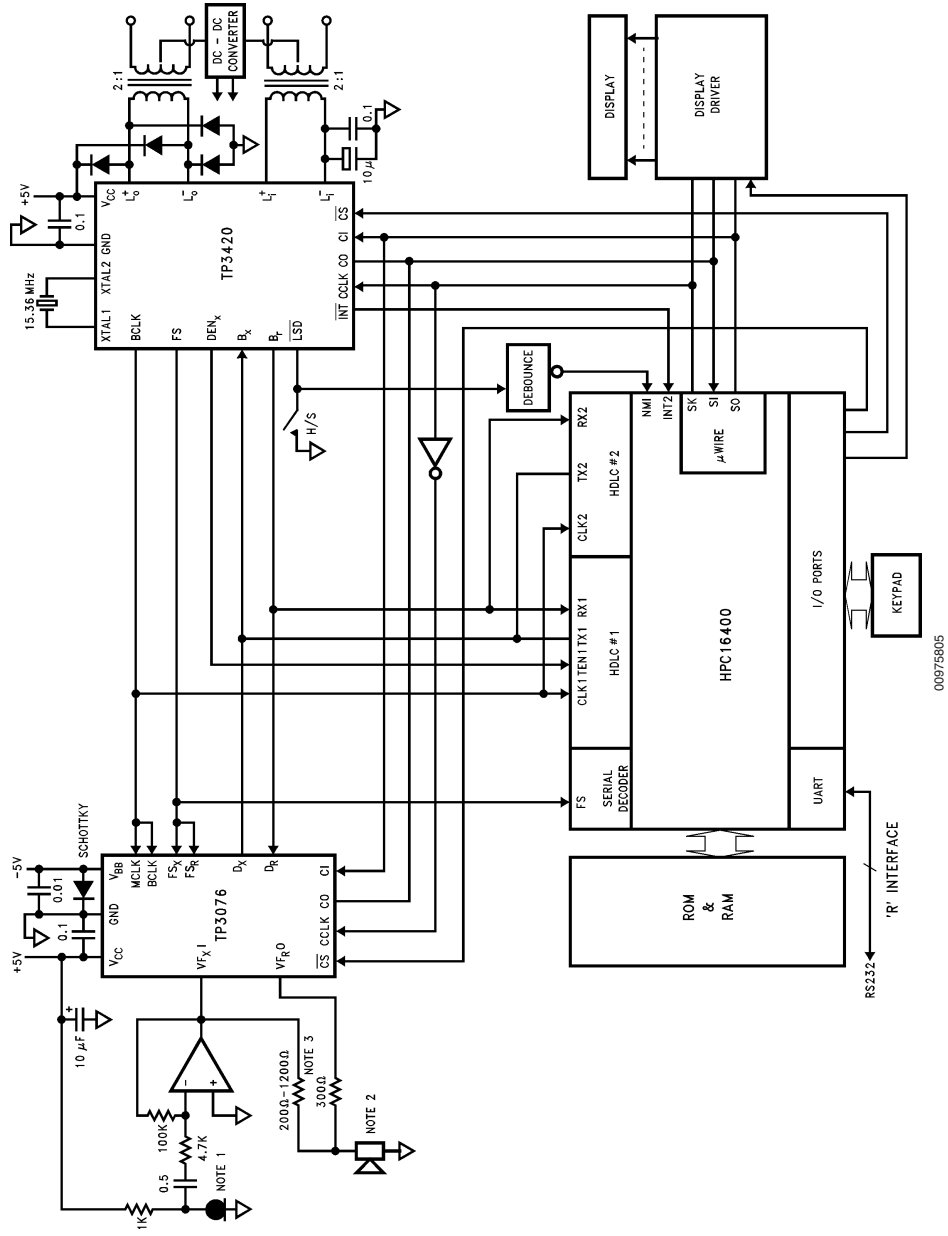

### POWER SUPPLIES

While the pins of the TP3076 COMBO II device are well protected against electrical misuse, it is recommended that the standard CMOS practice of applying GND to the device before any other connections are made should always be followed. In applications where the printed circuit card may be plugged into a hot socket with power and clocks already present, an extra long ground pin on the connector should be used and a Schottky diode connected between V<sub>BB</sub> and GND.

To minimize noise sources all ground connections to each device should meet at a common point as close as possible to the GND pin in order to prevent the interaction of ground return currents flowing through a common bus impedance. Power supply decoupling capacitors of 0.1  $\mu$ F should be connected from this common point to V<sub>CC</sub> and V<sub>BB</sub> as close to the device pins as possible.

Further guidelines on PCB layout techniques are provided in Application Note AN-614, "COMBO II™ Programmable PCM CODEC/Filter Family Application Guide".

Note 9: Primo type EM80—PMI2 or similar.

Note 10: Primo type DH81 or similar.

Note 11: Sidetone ≈ -9.2 dB for 200Ω,  
Sidetone ≈ -21.5 dB for 1200Ω.

FIGURE 1. Typical Application in an ISDN Phone

**Absolute Maximum Ratings** (Note 12)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

$V_{CC}$ to GND	7V
Voltage at $V_{FXI}$	$V_{CC} + 0.5V$ to $V_{BB} - 0.5V$
Voltage at Any Digital Input	$V_{CC} + 0.5V$ to GND $-0.5V$

Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$
$V_{BB}$ to GND	$-7V$
Current at $V_{FR0}$	$\pm 100$ mA
Current at Any Digital Output	$\pm 50$ mA
Lead Temperature (Soldering, 10 sec.)	$300^{\circ}C$

**Electrical Characteristics**

Unless otherwise noted, limits printed in **BOLD** characters are guaranteed for  $V_{CC} = +5V \pm 5\%$ ,  $V_{BB} = -5V \pm 5\%$ ;  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$  by correlation with 100% electrical testing at  $T_A = 25^{\circ}C$ . All other limits are assured by correlation with other production tests and/or product design and characterization. All signals referenced to GND. Typicals specified at  $V_{CC} = +5V$ ,  $V_{BB} = -5V$ ,  $T_A = 25^{\circ}C$ .

## Electrical Characteristics (Continued)

**Note 12:** "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits.

**Note 13:** See definitions and timing conventions section.

## Timing Specifications

Unless otherwise noted, limits printed in **BOLD** characters are guaranteed for  $V_{CC} = +5V \pm 5\%$ ;  $V_{BB} = -5V \pm 5\%$ ;  $T_A = 0^\circ C$  to  $+70^\circ C$  by correlation with 100% electrical testing at  $T_A = 25^\circ C$ . All other limits are assured by correlation with other production tests and/or product design and characterization. All signals referenced to GND. Typicals specified at  $V_{CC} = +5V$ ,  $V_{BB} = -5V$ ,  $T_A = 25^\circ C$ . All timing parameters are measured at  $V_{OH} = 2.0V$  and  $V_{OL} = 0.7V$ . See Definitions and Timing Conventions section for test methods information.

Transmit and receive gains programmed for maximum 0 dBm0 test levels (0 dB Gain). All other limits are assured by correlation with other production tests and/or product design and characterization. All signals referenced to GND. Typical values specified at  $V_{CC} = +5V$ ,  $V_{BB} = -5V$ ,  $T_A = 25^\circ\text{C}$ .

Symbol	Parameter	Conditions	Min	Typ	Max	Units
<b>NOISE</b>						
SOS	Spurious Out-of-Band Signals Applied at the Channel Output	0 dBm0 300 Hz to 3400 Hz Input PCM Code at $D_{R1}$ 4600 Hz–7600 Hz 7600 Hz–8400 Hz 8400 Hz–50,000 Hz			<b>-30</b> <b>-40</b> <b>-30</b>	dB dB dB
<b>DISTORTION</b>						
STD <sub>X</sub> STD <sub>R</sub>	Signal to Total Distortion Transmit or Receive Half-Channel, $\mu$ -Law Selected	Sinusoidal Test Method Level = 3.0 dBm0 = 0 dBm0 to -30 dBm0 = -40 dBm0 = -45 dBm0	<b>33</b> <b>36</b> <b>30</b> <b>25</b>			dBC dBC dBC dBC
STD <sub>RL</sub>	Single to Total Distortion Receive with Resistive Load	Sinusoidal Test Method Level = +3.1 dBm0 $R_L = 600\Omega$ , $G_R = -0.5\text{ dB}$ $R_L = 300\Omega$ , $G_R = -1.2\text{ dB}$	<b>33</b> <b>33</b>			dBC dBC
SFD <sub>X</sub>	Single Frequency Distortion, Transmit				<b>-46</b>	dB
SFD <sub>R</sub>	Single Frequency Distortion, Receive				<b>-46</b>	dB
IMD	Intermodulation Distortion	Transmit or Receive Two Frequencies in the Range 300 Hz–3400 Hz			<b>-41</b>	dB
<b>CROSSTALK</b>						
CT <sub>X-R</sub>	Transmit to Receive Crosstalk, 0 dBm0 Transmit Level	$f = 300\text{ Hz} - 3400\text{ Hz}$ $D_R = \text{Idle Code}$		-90	<b>-75</b>	dB
CT <sub>R-X</sub>	Receive to Transmit Crosstalk, 0 dBm0 Receive Level	$f = 300\text{ Hz} - 3400\text{ Hz}$ (Note 16)		-90	<b>-70</b>	dB

**Note 15:** Measured by grounded input at  $V_{FXI}$ .

**Note 16:** PPSR<sub>X</sub>, NPSR<sub>X</sub>, and CT<sub>R-X</sub> are measured with a -50 dBm0 activation signal applied to  $V_{FXI}$ .

**Note 17:** A signal is Valid if it is above  $V_{IH}$  or below  $V_{IL}$  and Invalid if it is between  $V_{IL}$  and  $V_{IH}$ . For the purposes of this specification the following conditions apply:

- All input signals are defined as:  $V_{IL} = 0.4V$ ,  $V_{IH} = 2.7V$ ,  $t_R < 10\text{ ns}$ ,  $t_F < 10\text{ ns}$ .
- $t_R$  is measured from  $V_{IL}$  to  $V_{IH}$ .  $t_F$  is measured from  $V_{IH}$  to  $V_{IL}$ .
- Delay Times are measured from the input signal Valid to the output signal Valid.
- Setup Times are measured from the data input Valid to the clock input Invalid.
- Hold Times are measured from the clock signal Valid to the data input Invalid.
- Pulse widths are measured from  $V_{IL}$  to  $V_{IL}$  or from  $V_{IH}$  to  $V_{IH}$ .

**Note 18:** A multi-tone test technique is used.

**Physical Dimensions** inches (millimeters) unless otherwise noted

**Molded Dual-In-Line Package (N)**  
**Order Number TP3076N-G**  
**NS Package Number N20A**

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.

**LIFE SUPPORT POLICY**

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**BANNED SUBSTANCE COMPLIANCE**

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
