

PCF85132

LCD driver for low multiplex rates

Rev. 1 — 23 November 2010

Product data sheet

1. General description

The PCF85132 is a peripheral device which interfaces to almost any Liquid Crystal Display (LCD)¹ with low multiplex rates. It generates the drive signals for any static or multiplexed LCD containing up to four backplanes and up to 160 segments. It can be easily cascaded for larger LCD applications. The PCF85132 is compatible with most microprocessors or microcontrollers and communicates via a two-line bidirectional I²C-bus. Communication overheads are minimized by a display RAM with auto-incremented addressing, by hardware subaddressing, and by display memory switching (static and duplex drive modes).

2. Features and benefits

- Single-chip LCD controller and driver for up to 640 elements
- Selectable backplane drive configuration: static, 2, 3, or 4 backplane multiplexing
- 160 segment drives:
 - ◆ Up to eighty 7-segment numeric characters
 - ◆ Up to forty 14-segment alphanumeric characters
 - ◆ Any graphics of up to 640 elements
- May be cascaded for large LCD applications (up to 5120 elements possible)
- 160 × 4-bit RAM for display data storage
- Software programmable frame frequency in steps of 5 Hz in the range of 60 Hz to 90 Hz; factory calibrated
- Wide LCD supply range: from 1.8 V for low threshold LCDs and up to 8.0 V for guest-host LCDs and high threshold (automobile) twisted nematic LCDs
- Internal LCD bias generation with voltage-follower buffers
- Selectable display bias configuration: static, 1/2, or 1/3
- Wide power supply range: from 1.8 V to 5.5 V
- LCD and logic supplies may be separated
- Low power consumption, typical: I_{DD} = 4 μA, I_{DD(LCD)} = 30 μA
- 400 kHz I²C-bus interface
- Auto-incremental display data loading across device subaddress boundaries
- Versatile blinking modes
- Compatible with Chip-On-Glass (COG) technology
- No external components
- Two sets of backplane outputs for optimal COG configurations of the application

1. The definition of the abbreviations and acronyms used in this data sheet can be found in [Section 15 on page 50](#).

6.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
SDAACK ^[1]	1 to 3	I ² C-bus acknowledge output
SDA ^[1]	4 to 6	I ² C-bus serial data input
SCL	7 to 9	I ² C-bus serial clock input
CLK	10	clock input and output
V _{DD}	11 to 13	supply voltage
$\overline{\text{SYNC}}$	14	cascade synchronization input and output
OSC	15	selection of internal or external clock
T1, T2, and T3	16, 17, and 18 to 20	dedicated testing pins; to be tied to V _{SS} in application mode
A0 and A1	21, 22	subaddress inputs
SA0	23	I ² C-bus slave address input
V _{SS} ^[2]	24 to 26	ground supply voltage
V _{LCD}	27 to 29	LCD supply voltage
BP2 and BP0	30, 31	LCD backplane outputs
S0 to S79	32 to 111	LCD segment outputs
BP0, BP2, BP1, and BP3	112 to 115	LCD backplane outputs
S80 to S159	116 to 195	LCD segment outputs
BP3 and BP1	196, 197	LCD backplane outputs

[1] For most applications SDA and SDAACK are shorted together (see [Section 12.2 on page 38](#)).

[2] The substrate (rear side of the die) is wired to V_{SS} and should be electrically isolated.

7. Functional description

The PCF85132 is a versatile peripheral device designed to interface between any microprocessor or microcontroller to a wide variety of LCD segment or dot matrix displays (see [Figure 3](#)). It can directly drive any static or multiplexed LCD containing up to four backplanes and up to 160 segments.

The display configurations possible with the PCF85132 depend on the required number of active backplane outputs. A selection of display configurations is given in [Table 4](#).

All of the display configurations given in [Table 4](#) can be implemented in a typical system as shown in [Figure 4](#).

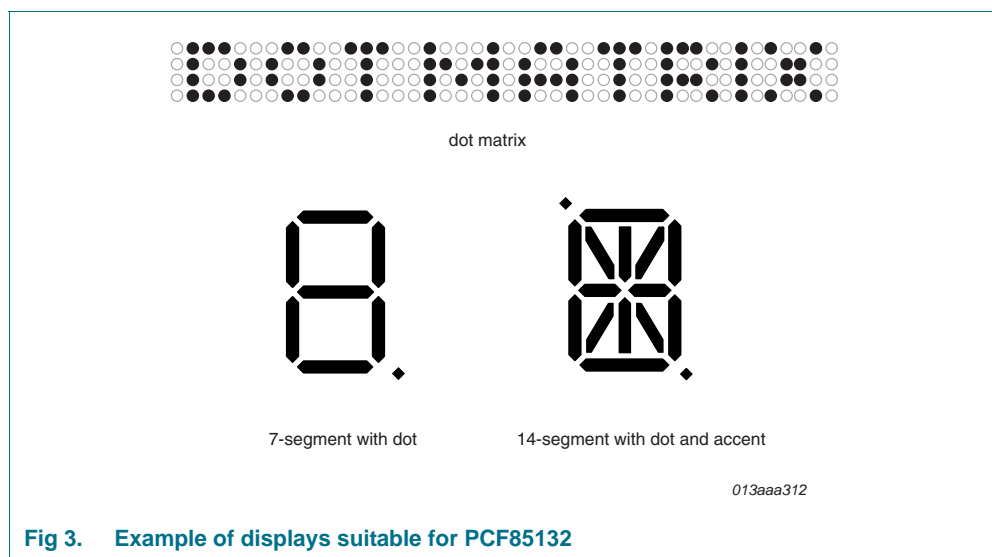

Fig 3. Example of displays suitable for PCF85132

Table 4. Selection of possible display configurations

Number of				
Backplanes	Icons	Digits/Characters		Dot matrix/ Elements
		7-segment	14-segment	
4	640	80	40	640 dots (4 × 160)
3	480	60	30	480 dots (3 × 160)
2	320	40	20	320 dots (2 × 160)
1	160	20	10	160 dots (1 × 160)

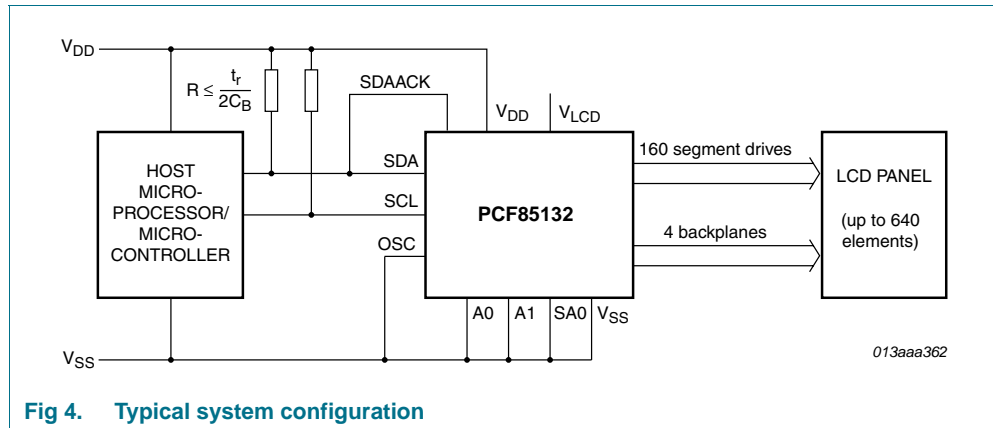

Fig 4. Typical system configuration

The host microprocessor or microcontroller maintains the 2-line I²C-bus communication channel with the PCF85132.

Biasing voltages for the multiplexed LCD waveforms are generated internally, removing the need for an external bias generator. The internal oscillator is selected by connecting pin OSC to V_{SS}. The only other connections required to complete the system are the power supplies (V_{DD}, V_{SS}, and V_{LCD}) and the LCD panel selected for the application.

7.1 Power-On Reset (POR)

At power-on the PCF85132 resets to the following starting conditions:

- All backplane and segment outputs are set to V_{LCD}
- The selected drive mode is 1:4 multiplex with 1/3 bias
- Blinking is switched off
- Input and output bank selectors are reset
- The I²C-bus interface is initialized
- The data pointer and the subaddress counter are cleared (set to logic 0)
- The display is disabled
- If internal oscillator is selected (pin OSC connected to V_{SS}), then there is no clock signal on pin CLK

Remark: Do not transfer data on the I²C-bus for at least 1 ms after a power-on to allow the reset action to complete.

7.2 LCD bias generator

Fractional LCD biasing voltages are obtained from an internal voltage divider of the three series resistors connected between V_{LCD} and V_{SS}. The center resistor is bypassed by switch if the 1/2 bias voltage level for the 1:2 multiplex configuration is selected.

7.3 LCD voltage selector

The LCD voltage selector coordinates the multiplexing of the LCD in accordance with the selected LCD drive configuration. The operation of the voltage selector is controlled by the mode-set command from the command decoder. The biasing configurations that apply to the preferred modes of operation, together with the biasing characteristics as functions of V_{LCD} and the resulting discrimination ratios (D) are given in [Table 5](#).

Table 5. Biasing characteristics

LCD drive mode	Number of:		LCD bias configuration	$\frac{V_{off(RMS)}}{V_{LCD}}$	$\frac{V_{on(RMS)}}{V_{LCD}}$	$D = \frac{V_{on(RMS)}}{V_{off(RMS)}}$
	Backplanes	Levels				
static	1	2	static	0	1	∞
1:2 multiplex	2	3	$\frac{1}{2}$	0.354	0.791	2.236
1:2 multiplex	2	4	$\frac{1}{3}$	0.333	0.745	2.236
1:3 multiplex	3	4	$\frac{1}{3}$	0.333	0.638	1.915
1:4 multiplex	4	4	$\frac{1}{3}$	0.333	0.577	1.732

A practical value for V_{LCD} is determined by equating $V_{off(RMS)}$ with a defined LCD threshold voltage (V_{th}), typically when the LCD exhibits approximately 10 % contrast. In the static drive mode a suitable choice is $V_{LCD} > 3V_{th}$.

Multiplex drive modes of 1:3 and 1:4 with $\frac{1}{2}$ bias are possible but the discrimination and hence the contrast ratios are smaller.

Bias is calculated by $\frac{1}{1+a}$, where the values for a are

a = 1 for $\frac{1}{2}$ bias

a = 2 for $\frac{1}{3}$ bias

The RMS on-state voltage ($V_{on(RMS)}$) for the LCD is calculated with [Equation 1](#):

$$V_{on(RMS)} = V_{LCD} \sqrt{\frac{a^2 + 2a + n}{n \times (1 + a)^2}} \quad (1)$$

where the values for n are

n = 1 for static drive mode

n = 2 for 1:2 multiplex drive mode

n = 3 for 1:3 multiplex drive mode

n = 4 for 1:4 multiplex drive mode

The RMS off-state voltage ($V_{off(RMS)}$) for the LCD is calculated with [Equation 2](#):

$$V_{off(RMS)} = V_{LCD} \sqrt{\frac{a^2 - 2a + n}{n \times (1 + a)^2}} \quad (2)$$

Discrimination is the ratio of $V_{on(RMS)}$ to $V_{off(RMS)}$ and is determined from [Equation 3](#):

$$D = \frac{V_{on(RMS)}}{V_{off(RMS)}} = \sqrt{\frac{(a+1)^2 + (n-1)}{(a-1)^2 + (n-1)}} \quad (3)$$

Using [Equation 3](#), the discrimination for an LCD drive mode of 1:3 multiplex with $\frac{1}{2}$ bias is $\sqrt{3} = 1.732$ and the discrimination for an LCD drive mode of 1:4 multiplex with $\frac{1}{2}$ bias is $\frac{\sqrt{21}}{3} = 1.528$.

The advantage of these LCD drive modes is a reduction of the LCD full scale voltage V_{LCD} as follows:

- 1:3 multiplex ($\frac{1}{2}$ bias): $V_{LCD} = \sqrt{6} \times V_{off(RMS)} = 2.449V_{off(RMS)}$
- 1:4 multiplex ($\frac{1}{2}$ bias): $V_{LCD} = \left[\frac{4 \times \sqrt{3}}{3} \right] = 2.309V_{off(RMS)}$

These compare with $V_{LCD} = 3V_{off(RMS)}$ when $\frac{1}{3}$ bias is used.

It should be noted that V_{LCD} is sometimes referred as the LCD operating voltage.

7.3.1 Electro-optical performance

Suitable values for $V_{on(RMS)}$ and $V_{off(RMS)}$ are dependant on the LCD liquid used. The RMS voltage, at which a pixel will be switched on or off, determine the transmissibility of the pixel.

For any given liquid, there are two threshold values defined. One point is at 10 % relative transmission (at V_{low}) and the other at 90% relative transmission (at V_{high}), see [Figure 5](#). For a good contrast performance, the following rules should be followed:

$$V_{on(RMS)} \geq V_{high} \quad (4)$$

$$V_{off(RMS)} \leq V_{low} \quad (5)$$

$V_{on(RMS)}$ and $V_{off(RMS)}$ are properties of the display driver and are affected by the selection of a, n (see [Equation 1](#) to [Equation 3](#)), and the V_{LCD} voltage.

V_{low} and V_{high} are properties of the LCD liquid and can be provided by the module manufacturer.

It is important to match the module properties to those of the driver in order to achieve optimum performance.

7.4 LCD drive mode waveforms

7.4.1 Static drive mode

The static LCD drive mode is used when a single backplane is provided in the LCD. Backplane and segment drive waveforms for this mode are shown in [Figure 6](#).

Fig 6. Static drive mode waveforms

7.4.2 1:2 multiplex drive mode

When two backplanes are provided in the LCD, the 1:2 multiplex mode applies. The PCF85132 allows the use of 1/2 bias or 1/3 bias in this mode as shown in Figure 7 and Figure 8.

Fig 7. Waveforms for the 1:2 multiplex drive mode with 1/2 bias

Fig 8. Waveforms for the 1:2 multiplex drive mode with 1/3 bias

7.4.3 1:3 multiplex drive mode

When three backplanes are provided in the LCD, the 1:3 multiplex drive mode applies as shown in [Figure 9](#).

Fig 9. Waveforms for the 1:3 multiplex drive mode with 1/3 bias

7.4.4 1:4 multiplex drive mode

When four backplanes are provided in the LCD, the 1:4 multiplex drive mode applies as shown in [Figure 10](#).

Fig 10. Waveforms for the 1:4 multiplex drive mode with 1/3 bias

7.5 Oscillator

The internal logic and the LCD drive signals of the PCF85132 are timed by a frequency f_{clk} which either is derived from the built-in oscillator frequency f_{osc} :

$$f_{clk} = \frac{f_{osc}}{64} \quad (6)$$

or equals an external clock frequency $f_{clk(ext)}$:

$$f_{clk} = f_{clk(ext)} \quad (7)$$

Remark: A clock signal must always be supplied to the device; removing the clock may freeze the LCD in a DC state, which is not suitable for the liquid crystal.

7.5.1 Internal clock

The internal oscillator is enabled by connecting pin OSC to V_{SS} . In this case the output from pin CLK provides the clock signal for cascaded PCF85132 in the system. However, the clock signal is only available at pin CLK, if the display is enabled. The display is enabled using the display enable bit (see [Table 10 on page 26](#)).

The output clock frequency is like specified in [Table 19 on page 34](#) with parameter f_{clk} .

7.5.2 External clock

Connecting pin OSC to V_{DD} enables an external clock source. Pin CLK then becomes the external clock input.

7.6 Timing and frame frequency

The timing of the PCF85132 organizes the internal data flow of the device. This includes the transfer of display data from the display RAM to the display segment outputs. In cascaded applications, the synchronization signal (SYNC) maintains the correct timing relationship between the PCF85132 in the system.

When the internal clock is used, the clock frequency can be programmed by software such that the frame frequency can be chosen in steps of 5 Hz in the range of 60 Hz to 90 Hz (see [Table 16 on page 28](#)). The internal oscillator is calibrated within an accuracy of $\pm 10\%$ (at $V_{DD} = 5.0\text{ V}$; $T_{amb} = 30\text{ }^\circ\text{C}$).

The timing also generates the LCD frame frequency derived from an integer division of f_{clk} (see [Table 16 on page 28](#)).

7.7 Display register

The display register holds the display data while the corresponding multiplex signals are generated.

7.8 Segment outputs

The LCD drive section includes 160 segment outputs (S0 to S159) which must be connected directly to the LCD. The segment output signals are generated in accordance with the multiplexed backplane signals and with data resident in the display register. When less than 160 segment outputs are required the unused segment outputs must be left open-circuit.

7.9 Backplane outputs

The LCD drive section includes four backplane outputs: BP0 to BP3. The backplane output signals are generated in accordance with the selected LCD drive mode.

- In the 1:4 multiplex drive mode BP0 to BP3 must be connected directly to the LCD.

If less than four backplane outputs are required the unused outputs can be left open-circuit.

- In 1:3 multiplex drive mode BP3 carries the same signal as BP1, therefore these two adjacent outputs can be tied together to give enhanced drive capabilities.
- In 1:2 multiplex drive mode BP0 and BP2, BP1 and BP3 respectively carry the same signals and may also be paired to increase the drive capabilities.
- In static drive mode the same signal is carried by all four backplane outputs and they can be connected in parallel for very high drive requirements.

The pins for the four backplanes BP0 to BP3 are available on both pin bars of the chip. In applications it is possible to use either the pins for the backplanes

- on the top pin bar
- on the bottom pin bar
- or both of them to increase the driving strength of the device.

When using all backplanes available they may be connected to the respective sibling (BP0 on the top pin bar with BP0 on the bottom pin bar and so on).

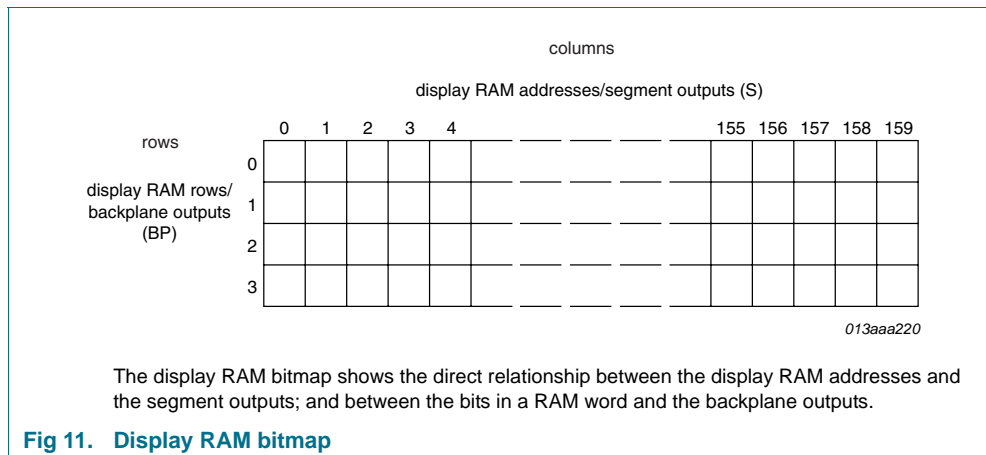

7.10 Display RAM

The display RAM is a static 160×4 bit RAM which stores LCD data. There is a one-to-one correspondence between

- the bits in the RAM bitmap and the LCD elements
- the RAM columns and the segment outputs
- the RAM rows and the backplane outputs.

A logic 1 in the RAM bitmap indicates the on-state of the corresponding LCD element; similarly, a logic 0 indicates the off-state.

The display RAM bit map, [Figure 11](#), shows the rows 0 to 3 which correspond with the backplane outputs BP0 to BP3, and the columns 0 to 159 which correspond with the segment outputs S0 to S159. In multiplexed LCD applications the segment data of the first, second, third, and fourth row of the display RAM are time-multiplexed with BP0, BP1, BP2, and BP3 respectively.

When display data is transmitted to the PCF85132 the received display bytes are stored in the display RAM in accordance with the selected LCD drive mode. The data is stored as it arrives and does not wait for the acknowledge cycle as with the commands. Depending on the current multiplex drive mode, data is stored singularly, in pairs, triples, or quadruples. To illustrate the filling order, an example of a 7-segment numeric display showing all drive modes is given in [Figure 12](#); the RAM filling organization depicted applies equally to other LCD types.

The following applies to [Figure 12](#):

- In static drive mode the eight transmitted data bits are placed in row 0 as one byte.
- In 1:2 multiplex drive mode the eight transmitted data bits are placed in pairs into row 0 and 1 as two successive 4-bit RAM words.
- In 1:3 multiplex drive mode the eight bits are placed in triples into row 0, 1, and 2 as three successive 3-bit RAM words, with bit 3 of the third address left unchanged. It is not recommended to use this bit in a display because of the difficult addressing. This last bit may, if necessary, be controlled by an additional transfer to this address but care should be taken to avoid overwriting adjacent data because always full bytes are transmitted.
- In 1:4 multiplex drive mode, the eight transmitted data bits are placed in quadruples into row 0, 1, 2, and 3 as two successive 4-bit RAM words.

Fig 12. Relationships between LCD layout, drive mode, display RAM filling order, and display data transmitted over the I²C-bus

7.11 Data pointer

The addressing mechanism for the display RAM is realized using the data pointer. This allows the loading of an individual display data byte, or a series of display data bytes, into any location of the display RAM. The sequence commences with the initialization of the data pointer by the load-data-pointer command (see [Table 8 on page 25](#)). Following this command, an arriving data byte is stored at the display RAM address indicated by the data pointer. The filling order is shown in [Figure 12](#).

After each byte is stored, the content of the data pointer is automatically incremented by a value dependent on the selected LCD drive mode:

- In static drive mode by eight
- In 1:2 multiplex drive mode by four
- In 1:3 multiplex drive mode by three
- In 1:4 multiplex drive mode by two

If an I²C-bus data access is terminated early then the state of the data pointer is unknown. The data pointer should be re-written prior to further RAM accesses.

7.12 Subaddress counter

The storage of display data is conditioned by the content of the subaddress counter. Storage is allowed only when the content of the subaddress counter matches with the hardware subaddress applied to A0 and A1. The subaddress counter value is defined by the device-select command (see [Table 13 on page 27](#)). If the content of the subaddress counter and the hardware subaddress do not match then data storage is inhibited but the data pointer is incremented as if data storage had taken place. The subaddress counter is also incremented when the data pointer overflows.

The storage arrangements described lead to extremely efficient data loading in cascaded applications. When a series of display bytes are sent to the display RAM, automatic wrap-over to the next PCF85132 occurs when the last RAM address is exceeded. Subaddressing across device boundaries is successful even if the change to the next device in the cascade occurs within a transmitted character (such as during the 27th display data byte transmitted in 1:3 multiplex mode).

The hardware subaddress must not be changed whilst the device is being accessed on the I²C-bus interface.

7.13 Output bank selector

The output bank selector (see [Table 14 on page 27](#)) selects one of the four rows per display RAM address for transfer to the display register. The actual row selected depends on the particular LCD drive mode in operation and on the instant in the multiplex sequence.

- In 1:4 multiplex mode, all RAM addresses of row 0 are selected, these are followed by the contents of row 1, row 2, and then row 3
- In 1:3 multiplex mode, rows 0, 1, and 2 are selected sequentially
- In 1:2 multiplex mode, rows 0 and 1 are selected
- In static mode, row 0 is selected

The PCF85132 includes a RAM bank switching feature in the static and 1:2 multiplex drive modes. In the static drive mode, the bank-select command may request the contents of row 2 to be selected for display instead of the contents of row 0. In the 1:2 multiplex mode, the contents of rows 2 and 3 may be selected instead of rows 0 and 1. This gives the provision for preparing display information in an alternative bank and to be able to switch to it once it is assembled.

7.14 Input bank selector

The input bank selector loads display data into the display RAM in accordance with the selected LCD drive configuration. Display data can be loaded in row 2 in static drive mode or in rows 2 and 3 in 1:2 multiplex drive mode by using the bank-select command (see [Table 14](#)). The input bank selector functions independently to the output bank selector.

7.15 Blinker

The display blinking capabilities of the PCF85132 are very versatile. The whole display can blink at frequencies selected by the blink-select command (see [Table 15 on page 28](#)). The blink frequencies are fractions of the clock frequency. The ratios between the clock and blink frequencies depend on the blink mode in which the device is operating (see [Table 6](#)).

Table 6. Blink frequencies

Assuming that $f_{clk} = 1.800$ kHz.

Blink mode	Operating mode ratio	Blink frequency
off	-	blinking off
1	$f_{blink} = \frac{f_{clk}}{768}$	~2.34 Hz
2	$f_{blink} = \frac{f_{clk}}{1536}$	~1.17 Hz
3	$f_{blink} = \frac{f_{clk}}{3072}$	~0.59 Hz

An additional feature is for an arbitrary selection of LCD elements to blink. This applies to the static and 1:2 multiplex drive modes and can be implemented without any communication overheads. By means of the output bank selector, the displayed RAM banks are exchanged with alternate RAM banks at the blink frequency. This mode can also be specified by the blink-select command (see [Table 15](#)).

In the 1:3 and 1:4 multiplex modes, where no alternate RAM bank is available, groups of LCD elements can blink selectively by changing the display RAM data at fixed time intervals.

The entire display can blink at a frequency other than the nominal blinking frequency. This can be effectively performed by resetting and setting the display enable bit E at the required rate using the mode-set command (see [Table 10](#)).

7.16 Characteristics of the I²C-bus

The I²C-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a Serial DATA line (SDA) and a Serial Clock Line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

By connecting pin SDAACK to pin SDA on the PCF85132, the SDA line becomes fully I²C-bus compatible. In COG applications where the track resistance from the SDAACK pin to the system SDA line can be significant, possibly a voltage divider is generated by the bus pull-up resistor and the Indium Tin Oxide (ITO) track resistance. As a consequence it may be possible that the acknowledge generated by the PCF85132 can't be interpreted as logic 0 by the master. In COG applications where the acknowledge cycle is required, it is therefore necessary to minimize the track resistance from the SDAACK pin to the system SDA line to guarantee a valid LOW level.

By separating the acknowledge output from the serial data line (having the SDAACK open circuit) design efforts to generate a valid acknowledge level can be avoided. However, in that case the I²C-bus master has to be set up in such a way that it ignores the acknowledge cycle.²

The following definition assumes SDA and SDAACK are connected and refers to the pair as SDA.

7.16.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as a control signal (see [Figure 13](#)).

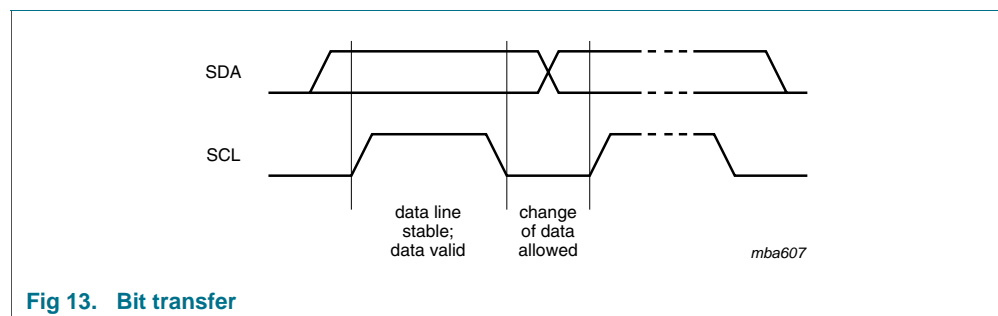

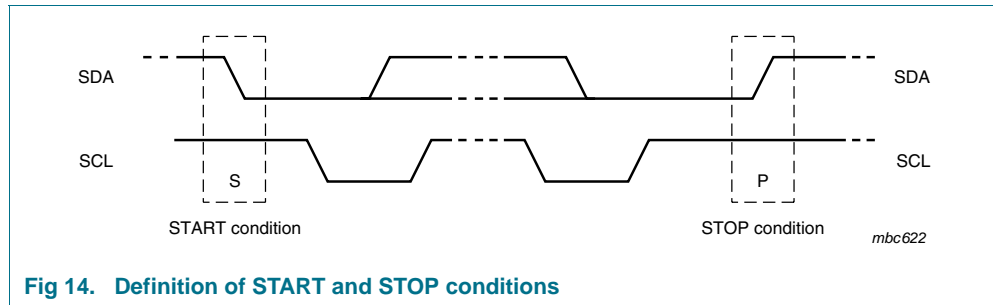

Fig 13. Bit transfer

7.16.1.1 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW change of the data line, while the clock is HIGH is defined as the START condition (S).

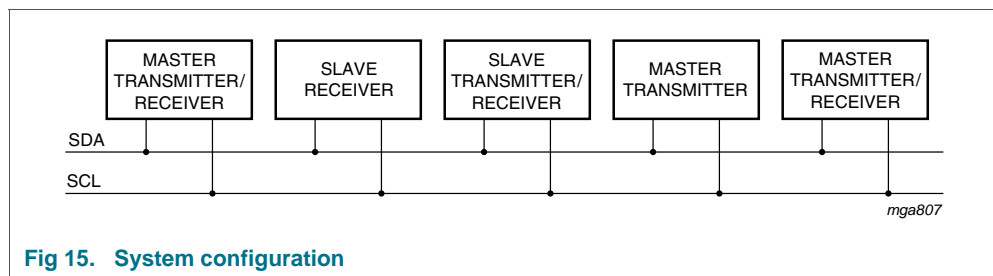

A LOW-to-HIGH change of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are shown in [Figure 14](#).

2. For further information, please consider the NXP application note: [Ref. 1 "AN10170"](#).

7.16.2 System configuration

A device generating a message is a transmitter; a device receiving a message is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves. The system configuration is shown in [Figure 15](#).

7.16.3 Acknowledge

The number of data bytes transferred between the START and STOP conditions from transmitter to receiver is unlimited. Each byte of eight bits is followed by an acknowledge cycle.

- A slave receiver which is addressed must generate an acknowledge after the reception of each byte.
- Also a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter.
- The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration).
- A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

Acknowledgement on the I²C-bus is shown in [Figure 16](#).

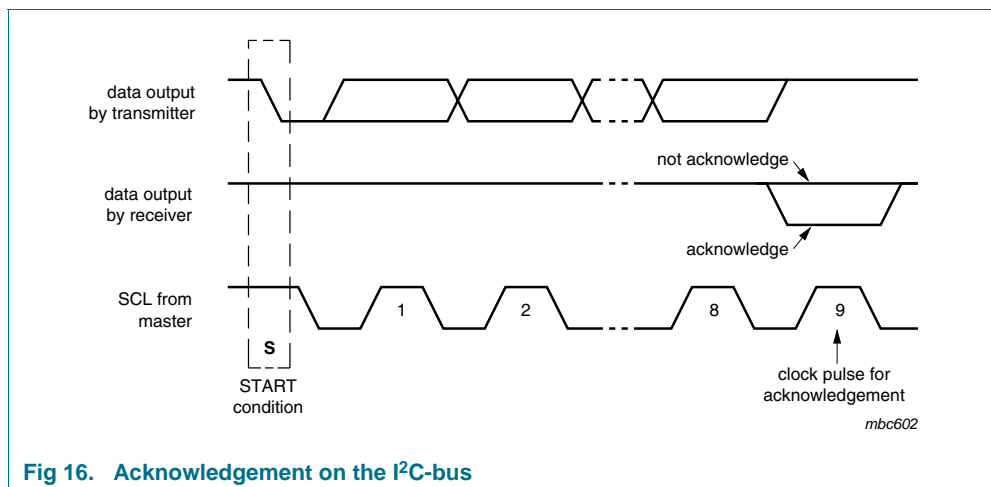

Fig 16. Acknowledgement on the I²C-bus

7.16.4 I²C-bus controller

The PCF85132 acts as an I²C-bus slave receiver. It does not initiate I²C-bus transfers or transmit data to an I²C-bus master receiver. The only data output from the PCF85132 are the acknowledge signals from the selected devices. Device selection depends on the I²C-bus slave address, on the transferred command data, and on the hardware subaddress.

In single device applications, the hardware subaddress inputs A0 and A1 are normally tied to V_{SS} which defines the hardware subaddress 0. In multiple device applications A0 and A1 are tied to V_{SS} or V_{DD} in accordance with a binary coding scheme such that no two devices with a common I²C-bus slave address have the same hardware subaddress.

7.16.5 Input filters

To enhance noise immunity in electrical adverse environments, RC low-pass filters are provided on the SDA and SCL lines.

7.16.6 I²C-bus protocol

Two I²C-bus slave addresses (0111 000 and 0111 001) are reserved for the PCF85132. The entire I²C-bus slave address byte is shown in [Table 7](#).

Table 7. I²C slave address byte

Bit	Slave address							0 LSB
	7 MSB	6	5	4	3	2	1	
	0	1	1	1	0	0	SA0	R/ \overline{W}

The PCF85132 is a write-only device and will not respond to a read access, therefore bit 0 should always be logic 0. Bit 1 of the slave address byte, that a PCF85132 will respond to, is defined by the level tied to its SA0 input (V_{SS} for logic 0 and V_{DD} for logic 1).

Having two reserved slave addresses allows the following on the same I²C-bus:

- Up to 8 PCF85132 on the same I²C-bus for very large LCD applications
- The use of two types of LCD multiplex on the same I²C-bus

The I²C-bus protocol is shown in Figure 17. The sequence is initiated with a START condition (S) from the I²C-bus master which is followed by one of two possible PCF85132 slave addresses available. All PCF85132 with the corresponding SA0 level acknowledge in parallel to the slave address, but all PCF85132 with the alternative SA0 level ignore the whole I²C-bus transfer.

Fig 17. I²C-bus protocol

After acknowledgement, a control byte follows which defines if the next byte is RAM or command information. The control byte also defines if the next byte is a control byte or further RAM or command data.

Table 8. Control byte description

Bit	Symbol	Value	Description
7	CO		continue bit
		0	last control byte
		1	control bytes continue
6	RS		register selection
		0	command register
		1	data register
5 to 0	-		not relevant

Fig 18. Control byte format

In this way it is possible to configure the device and then fill the display RAM with little overhead.

The command bytes and control bytes are also acknowledged by all addressed PCF85132 connected to the bus.

The display bytes are stored in the display RAM at the address specified by the data pointer and the subaddress counter; see [Section 7.11](#) and [Section 7.12](#).

The acknowledgement after each byte is made only by the (A0 and A1) addressed PCF85132. After the last (display) byte, the I²C-bus master issues a STOP condition (P). Alternatively a START may be asserted to RESTART an I²C-bus access.

7.17 Command decoder

The command decoder identifies command bytes that arrive on the I²C-bus. The commands available to the PCF85132 are defined in [Table 9](#).

Table 9. Definition of PCF85132 commands

Command	Operation code								Reference
	7	6	5	4	3	2	1	0	
mode-set	1	1	0	0	E	B	M[1:0]		Table 10
load-data-pointer-MSB	0	0	0	0	P[7:4]				Table 11

device-select	1	1	1	0	0	0	A[1:0]		Table 13
bank-select	1	1	1	1	1	0	I	O	Table 14
blink-select	1	1	1	1	0	AB	BF[1:0]		Table 15
frame-frequency-prescaler	1	1	1	0	1	F[2:0]			Table 16

Table 10. Mode-set command bit description

Bit	Symbol	Value	Description
7 to 4	-	1100	fixed value
3	E		display status
		0 ^[1]	disabled (blank) ^[2]
		1	enabled
2	B		LCD bias configuration
		0 ^[1]	1/3 bias
		1	1/2 bias
1 to 0	M[1:0]		LCD drive mode selection
		01	static; BP0
		10	1:2 multiplex; BP0, BP1
		11	1:3 multiplex; BP0, BP1, BP2
		00 ^[1]	1:4 multiplex; BP0, BP1, BP2, BP3

[1] Power-on and reset value.

[2] The possibility to disable the display allows implementation of blinking under external control; the enable bit determines also whether the internal clock signal is available at the CLK pin (see [Section 7.5.1 on page 16](#)).

Table 11. Load-data-pointer-MSB command bit description

Bit	Symbol	Value	Description
7 to 4	-	0000	fixed value
3 to 0	P[7:4]	0000 ^[1] to 1001	P7 to P4 defines the first 4 (most significant) bits of the data pointer that indicates one of the 160 display RAM addresses

[1] Power-on and reset value.

Table 12. Load-data-pointer-LSB command bit description

Bit	Symbol	Value	Description
7 to 4	-	0100	fixed value
3 to 0	P[3:0]	0000 ^[1] to 1111	P3 to P0 defines the last 4 (least significant) bits of the data pointer that indicates one of the 160 display RAM addresses

[1] Power-on and reset value.

Table 13. Device-select command bit description

Bit	Symbol	Value	Description
7 to 2	-	111000	fixed value
1 to 0	A[1:0]	00 ^[1] to 11	two bits of immediate data, bits A0 to A1, are transferred to the subaddress counter to define one of four hardware subaddresses (see Table 20 on page 39)

[1] Power-on and reset value.

Table 14. Bank-select command bit description

Bit	Symbol	Value	Description	
			Static	1:2 multiplex ^[1]
7 to 2	-	111110	fixed value	
1	I		input bank selection ; storage of arriving display data	
		0 ^[2]	RAM bit 0	RAM bits 0 and 1
		1	RAM bit 2	RAM bits 2 and 3
0	O		output bank selection ; retrieval of LCD display data	
		0 ^[2]	RAM bit 0	RAM bits 0 and 1
		1	RAM bit 2	RAM bits 2 and 3

[1] The bank-select command has no effect in 1:3 and 1:4 multiplex drive modes.

[2] Power-on and reset value.

Table 15. Blink-select command bit description

Bit	Symbol	Value	Description
7 to 3	-	11110	fixed value
2	AB		blink mode selection
		0 ^[1]	normal blinking ^[2]
		1	alternate RAM bank blinking ^[3]
1 to 0	BF[1:0]		blink frequency selection
		00 ^[1]	off
		01	1
		10	2
		11	3

[1] Power-on and reset value.

[2] Normal blinking is assumed when the LCD multiplex drive modes 1:3 or 1:4 are selected.

[3] Alternate RAM bank blinking does not apply in 1:3 and 1:4 multiplex drive modes.

Table 16. Frame-frequency-prescaler command bit description

Bit	Symbol	Value	Description	
			Nominal frame frequency ^[1]	Equation
7 to 4	-	11101	fixed value	
3 to 0	F[2:0]		defines the division factor for the frame frequency f_{fr}	
		000	60 Hz	$f_{fr} = \frac{64}{80} \times \frac{f_{clk}}{24}$
		001	65 Hz	$f_{fr} = \frac{64}{74} \times \frac{f_{clk}}{24}$
		010	70 Hz	$f_{fr} = \frac{64}{68} \times \frac{f_{clk}}{24}$
		011 ^[2]	75 Hz	$f_{fr} = \frac{f_{clk}}{24}$

		101	85 Hz	$f_{fr} = \frac{64}{56} \times \frac{f_{clk}}{24}$
		110	90 Hz	$f_{fr} = \frac{64}{53} \times \frac{f_{clk}}{24}$
		111	75 Hz	$f_{fr} = \frac{f_{clk}}{24}$

[1] Nominal frame frequency calculated for an internal operating frequency of 1.800 kHz.

[2] Power-on and reset value.

7.18 Display controller

The display controller executes the commands identified by the command decoder. It contains the status registers of the PCF85132 and co-ordinates their effects. The controller is also responsible for loading display data into the display RAM as required by the filling order.

8. Internal circuitry

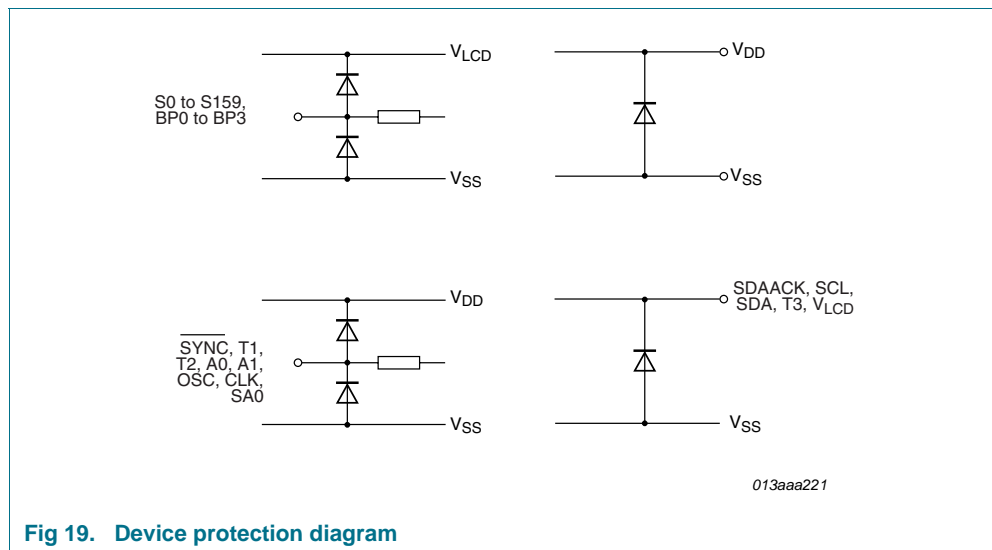

Fig 19. Device protection diagram

9. Limiting values

CAUTION

Static voltages across the liquid crystal display can build up when the LCD supply voltage (V_{LCD}) is on while the IC supply voltage (V_{DD}) is off, or vice versa. This may cause unwanted display artifacts. To avoid such artifacts, V_{LCD} and V_{DD} must be applied or removed together.

Table 17. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134), [1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DD}	supply voltage		-0.5	+6.5	V
I_{DD}	supply current		-50	+50	mA
V_{LCD}	LCD supply voltage		-0.5	+9.0	V
$I_{DD(LCD)}$	LCD supply current		-50	+50	mA
V_i	input voltage	on pins CLK, \overline{SYNC} , SA0, OSC, SDA, SCL, A0, A1, T1, T2, and T3	-0.5	+6.5	V
I_i	input current		-10	+10	mA
V_O	output voltage	on pins S0 to S159 and BP0 to BP3	-0.5	+9.0	V
		on pins \overline{SDAACK} , CLK, \overline{SYNC}	-0.5	+6.5	V
I_O	output current		-10	+10	mA
I_{SS}	ground supply current		-50	+50	mA
P_{tot}	total power dissipation		-	400	mW
P/out	power dissipation per output		-	100	mW
V_{ESD}	electrostatic discharge voltage	HBM	[2]	-	±4500 V
		MM	[3]	-	±250 V
I_{lu}	latch-up current		[4]	-	200 mA
T_{stg}	storage temperature		[5]	-65	+150 °C
T_{amb}	ambient temperature	operating device	-40	+85	°C

[1] Stresses above these values listed may cause permanent damage to the device.

[2] Pass level; Human Body Model (HBM) according to [Ref. 5 "JESD22-A114"](#).

[3] Pass level; Machine Model (MM), according to [Ref. 6 "JESD22-A115"](#).

[4] Pass level; latch-up testing, according to [Ref. 7 "JESD78"](#) at maximum ambient temperature ($T_{amb(max)} = 85\text{ °C}$).

[5] According to the NXP store and transport requirements (see [Ref. 9 "NX3-00092"](#)) the devices have to be stored at a temperature of +8 °C to +45 °C and a humidity of 25 % to 75 %. For long term storage products deviant conditions are described in that document.

10. Static characteristics

Table 18. Static characteristics
 $V_{DD} = 1.8\text{ V to }5.5\text{ V}$; $V_{SS} = 0\text{ V}$; $V_{LCD} = 1.8\text{ V to }8.0\text{ V}$; $T_{amb} = -40\text{ }^{\circ}\text{C to }+85\text{ }^{\circ}\text{C}$; unless otherwise specified.

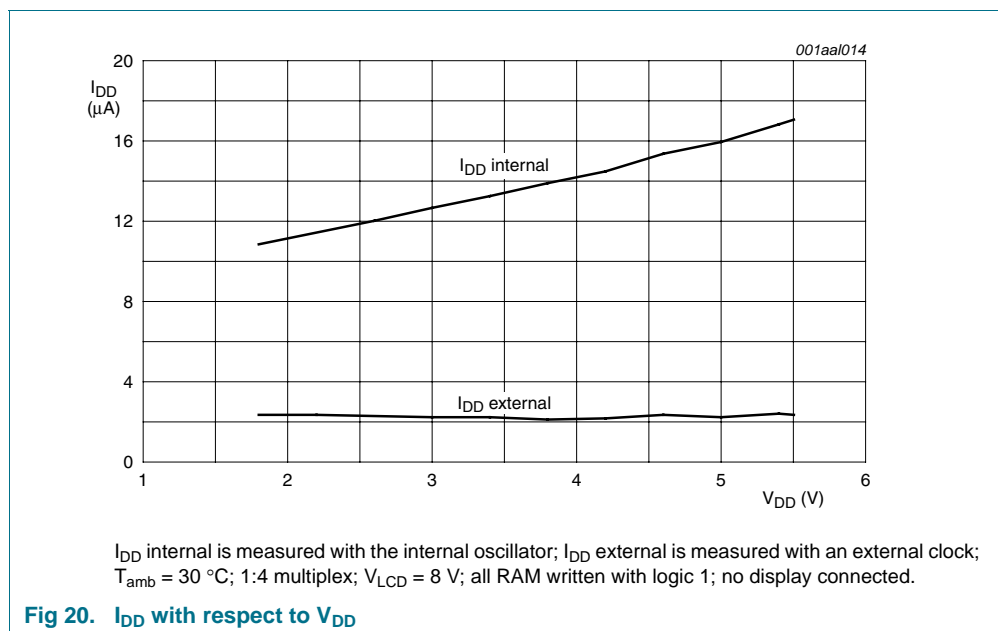

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Supplies						
V_{DD}	supply voltage		1.8	-	5.5	V
V_{LCD}	LCD supply voltage		1.8	-	8.0	V
I_{DD}	supply current	$f_{clk(ext)} = 1.800\text{ kHz}$	[1][2][3]	-	20	μA
		with internal oscillator running	[1][3]	-	60	μA

Timing characteristics: I²C-bus[5]						
f_{SCL}	SCL clock frequency		-	-	400	kHz
t_{BUF}	bus free time between a STOP and START condition		1.3	-	-	μs
$t_{HD;STA}$	hold time (repeated) START condition		0.6	-	-	μs
$t_{SU;STA}$	set-up time for a repeated START condition		0.6	-	-	μs
$t_{VD;ACK}$	data valid acknowledge time		-	-	0.9	μs
t_{LOW}	LOW period of the SCL clock		1.3	-	-	μs
t_{HIGH}	HIGH period of the SCL clock		0.6	-	-	μs
t_f	fall time	of both SDA and SCL signals	-	-	0.3	μs
t_r	rise time	of both SDA and SCL signals	-	-	0.3	μs
C_b	capacitive load for each bus line		-	-	400	pF
$t_{SU;DAT}$	data set-up time		200	-	-	ns
$t_{HD;DAT}$	data hold time		0	-	-	ns
$t_{SU;STO}$	set-up time for STOP condition		0.6	-	-	μs
t_{SP}	pulse width of spikes that must be suppressed by the input filter		-	-	50	ns

[1] Typical output duty factor: 50 % measured at the CLK output pin.

[2] For the respective frame frequency f_{fr} see [Table 16](#).

[3] For the characteristics of V_{DD} at a fixed temperature or of the temperature at a fixed V_{DD} , see [Figure 22](#) and [Figure 23](#).

[4] For $f_{CLK(ext)} > 4\text{ kHz}$ it is recommended to use an external pull-up resistor between pin $\overline{\text{SYNC}}$ and pin V_{DD} . The value of the resistor should be between 100 k Ω and 1 M Ω .

[5] All timing values are valid within the operating supply voltage and ambient temperature range and are referenced to V_{IL} and V_{IH} with an input voltage swing of V_{SS} to V_{DD} .

Fig 24. Driver timing waveforms

Fig 25. I²C-bus timing waveforms when SDA and SDAACK are connected

12. Application information

12.1 Pull-up resistor sizing on I²C-bus

12.1.1 Max value of pull-up resistor

The bus capacitance (C_b) is the total capacitance of wire, connections, and pins. This capacitance on pin SDA limits the maximum value of the pull-up resistor (R_{PU}) due to the specified rise time.

According to the I²C-bus specification the rise time (t_r) is defined between the V_{DD} related input threshold of $V_{IL} = 0.3V_{DD}$ and $V_{IH} = 0.7V_{DD}$. The value for $t_{r(max)}$ is 300 ns.

t_r will be calculated with [Equation 8](#):

$$t_r = t2 - t1 \quad (8)$$

whereas $t1$ and $t2$ are the time since the charging started. The values for $t1$ and $t2$ are derivatives of the functions $V(t1)$ and $V(t2)$:

$$V(t1) = 0.3V_{DD} = V_{DD}(1 - e^{-t1/R_{PU}C_b}) \quad (9)$$

$$V(t2) = 0.7V_{DD} = V_{DD}(1 - e^{-t2/R_{PU}C_b}) \quad (10)$$

with the results of

$$t1 = -R_{PU}C_b \times \ln(0.7) \quad (11)$$

$$t2 = -R_{PU}C_b \times \ln(0.3) \quad (12)$$

$$t_r = -R_{PU}C_b \times \ln(0.3) + R_{PU}C_b \times \ln(0.7) \quad (13)$$

$R_{PU(max)}$ is a function of the rise time (t_r) and the bus capacitance (C_b) and will be calculated with [Equation 14](#):

$$R_{PU(max)} = \frac{t_r}{0.8473C_b} = \frac{300 \times 10^{-9}}{0.8473C_b} \quad (14)$$

12.1.2 Min value of pull-up resistor

The supply voltage limits the minimum value of resistor R_{PU} due to the specified minimum sink current (see value of I_{OL} on pin SDAACK in [Table 18](#)). $R_{PU(min)}$ as a function of V_{DD} is calculated with [Equation 15](#):

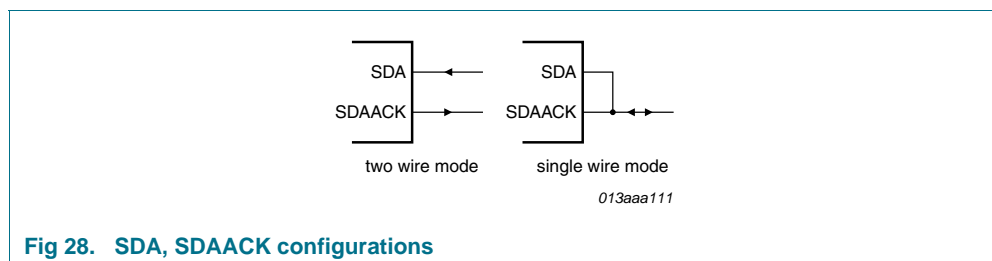

$$R_{PU(min)} = \frac{V_{DD} - V_{OL}}{I_{OL}} \quad (15)$$

The designer now has the minimum and maximum value of R_{PU} . The values for $R_{PU(max)}$ and $R_{PU(min)}$ are shown in [Figure 26](#) and [Figure 27](#).

12.2 SDA and SDAACK configuration

The Serial Data line (SDA) and the I²C-bus acknowledge line (SDAACK) are split. Both lines can be connected together to facilitate a single line SDA.

12.3 Cascaded operation

In large display configurations, up to 8 PCF85132 can be distinguished on the same I²C-bus by using the 2-bit hardware subaddress (A0 and A1) and the programmable I²C-bus slave address (SA0).

Table 20. Addressing cascaded PCF85132

Cluster	Bit SA0	Pin A1	Pin A0	Device
1	0	0	0	0
		0	1	1
		1	0	2
		1	1	3
2	1	0	0	4
		0	1	5
		1	0	6
		1	1	7

When cascaded PCF85132 are synchronized, they can share the backplane signals from one of the devices in the cascade. Such an arrangement is cost-effective in large LCD applications since the backplane outputs of only one device need to be through-plated to the backplane electrodes of the display. The other PCF85132 of the cascade contribute additional segment outputs but their backplane outputs are left open-circuit (see [Figure 29](#)).

For display sizes that are not multiple of 640 elements, a mixed cascaded system can be considered containing only devices like PCF85132 and PCF85133. Depending on the application, one must take care of the software commands compatibility and pin connection compatibility.

The $\overline{\text{SYNC}}$ line is provided to maintain the correct synchronization between all cascaded PCF85132. This synchronization is guaranteed after the Power-On Reset (POR). The only time that $\overline{\text{SYNC}}$ is likely to be needed is if synchronization is accidentally lost (e.g. by noise in adverse electrical environments, or by the definition of a multiplex mode when PCF85132 with different SA0 levels are cascaded). $\overline{\text{SYNC}}$ is organized as an input/output pin; the output selection being realized as an open-drain driver with an internal pull-up resistor. A PCF85132 asserts the $\overline{\text{SYNC}}$ line at the onset of its last active backplane signal and monitors the $\overline{\text{SYNC}}$ line at all other times. Should synchronization in the cascade be lost, it will be restored by the first PCF85132 to assert $\overline{\text{SYNC}}$. The timing relationship between the backplane waveforms and the $\overline{\text{SYNC}}$ signal for the various drive modes of the PCF85132 are shown in [Figure 31](#).

When using an external clock signal with high frequencies ($f_{\text{clk(Ext)}} > 4 \text{ kHz}$) it is recommended to have an external pull-up resistor between pin $\overline{\text{SYNC}}$ and pin V_{DD} (see [Table 19](#)). This resistor should be present even when no cascading configuration is used! When using it in a cascaded configuration, care must be taken not to route the $\overline{\text{SYNC}}$ signal to close to noisy signals.

The contact resistance between the $\overline{\text{SYNC}}$ pads of cascaded devices must be controlled. If the resistance is too high, the device will not be able to synchronize properly. This is particularly applicable to COG applications. [Table 21](#) shows the limiting values for contact resistance.

Table 21. $\overline{\text{SYNC}}$ contact resistance

Number of devices	Maximum contact resistance
2	6000 Ω
3 to 5	2200 Ω
6 to 8	1200 Ω

In the cascaded applications, the OSC pin of the PCF85132 with subaddress 0 is connected to V_{SS} so that this device uses its internal clock to generate a clock signal at the CLK pin. The other PCF85132 devices are having the OSC pin connected to V_{DD} , meaning that these devices are ready to receive external clock, the signal being provided by the device with subaddress 0.

In the case that the master is providing the clock signal to the slave devices, care must be taken that the sending of display enable or disable will be received by both, the master and the slaves at the same time. When the display is disabled the output from pin CLK is disabled too. The disconnection of the clock may result in a DC component for the display.

Alternatively, the schematic can be also constructed such that all the devices have OSC pin connected to V_{DD} and thus an external CLK being provided for the system (all devices connected to the same external CLK).

A configuration where $\overline{\text{SYNC}}$ is connected but all PCF85132 are using the internal clock (OSC pin tied to V_{SS}) is not recommended and may lead to display artifacts!

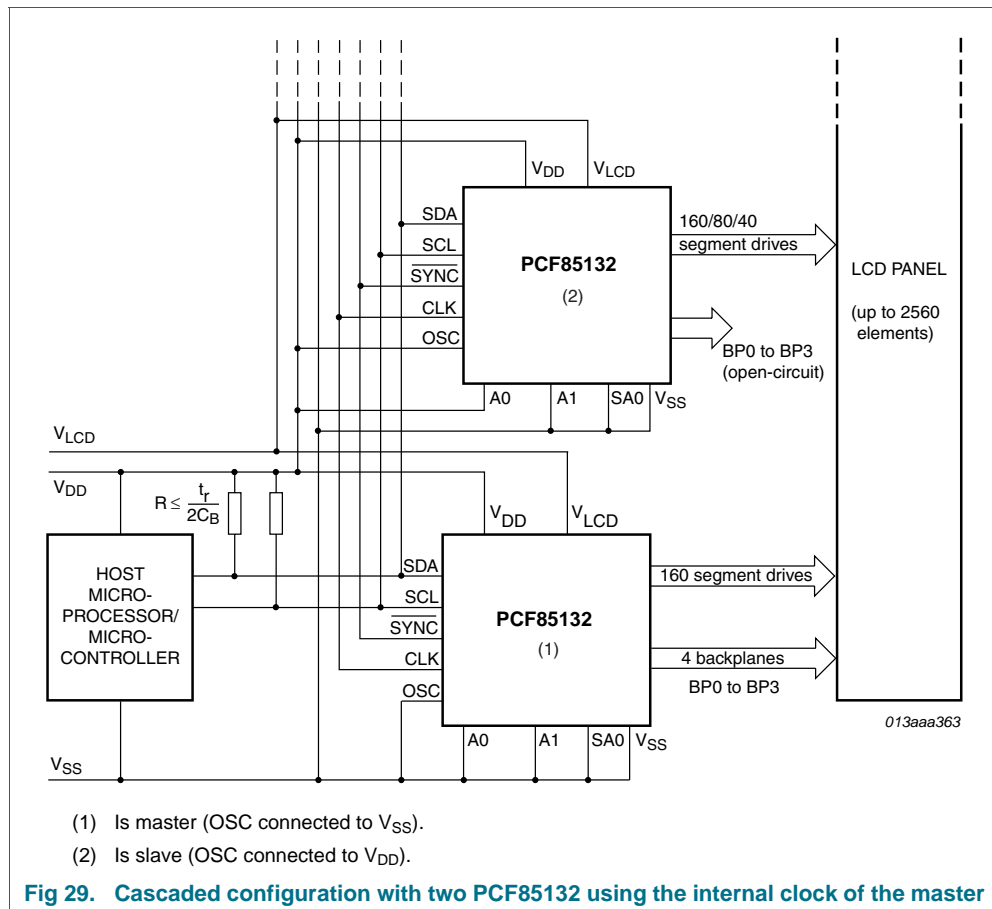

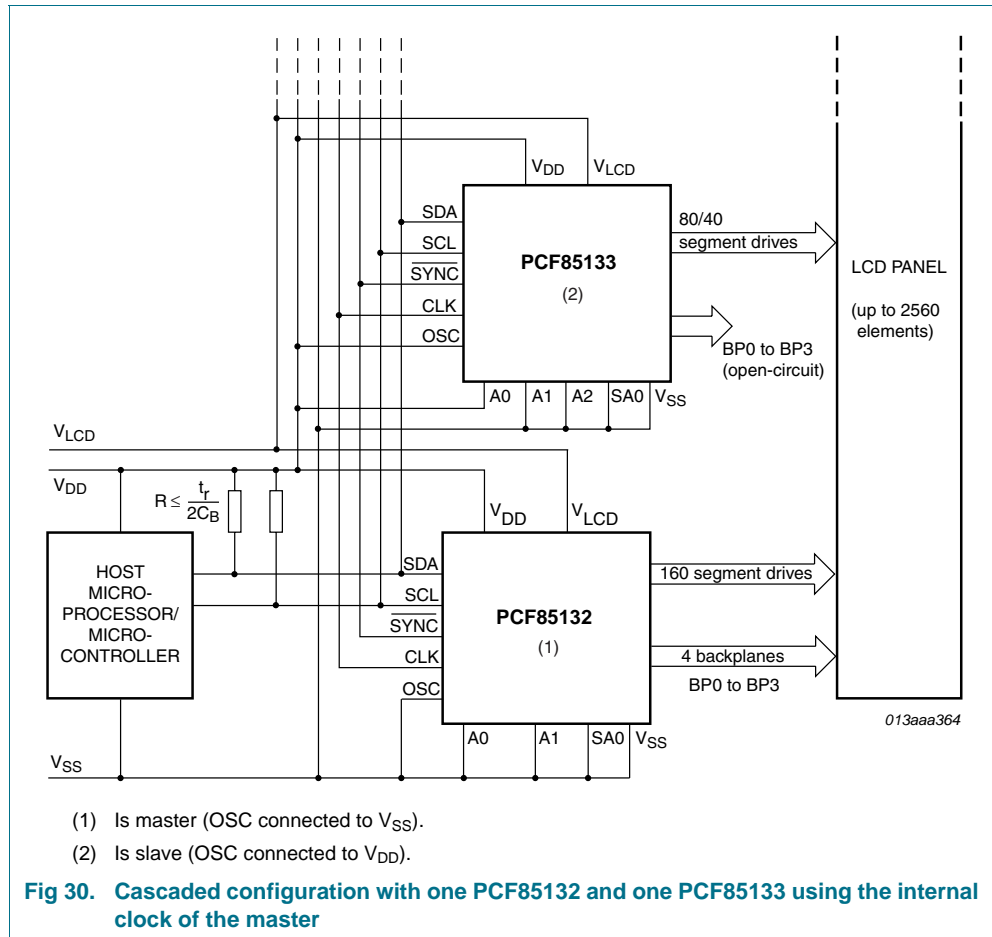

Fig 29. Cascaded configuration with two PCF85132 using the internal clock of the master

The dummy pins are connected to the segments shown (see [Table 23](#)) but are not tested.

Table 23. Dummy bumps

All x/y coordinates represent the position of the center of each bump with respect to the center (x/y = 0) of the chip; see [Figure 32](#).

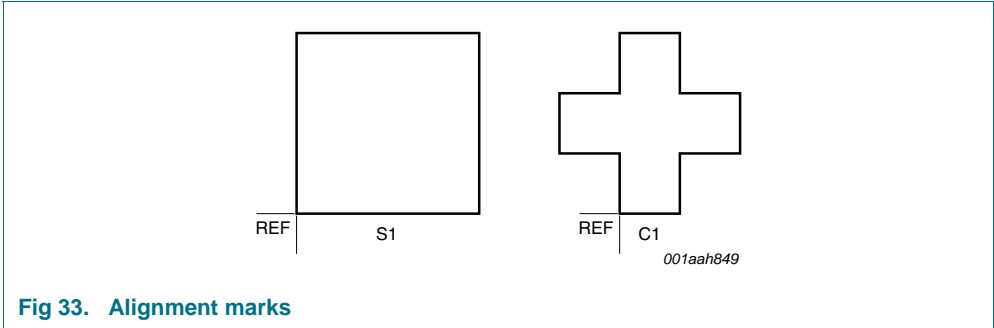

Symbol	Connected to Pin	X (μm)	Y (μm)
D1	S131	-3079.2	-481.5
D2	S28	3065.9	-481.5
D3	S29	3121.7	481.5
D4	S130	-3094.7	481.5

The alignment marks are shown in [Table 24](#).

Table 24. Alignment marking

All x/y coordinates represent the position of the REF point (see [Figure 33](#)) with respect to the center (x/y = 0) of the chip; see [Figure 32](#).

Symbol	Size (μm)	X (μm)	Y (μm)
S1	121.5 × 121.5	-2733.75	-47.25
C1	121.5 × 121.5	2603.7	-47.25

14. Packing information

Table 25. Tray dimensions (see [Figure 34](#))

Symbol	Description	Value
A	pocket pitch in x direction	8.8 mm
B	pocket pitch in y direction	3.6 mm
C	pocket width in x direction	6.65 mm
D	pocket width in y direction	1.31 mm
E	tray width in x direction	50.8 mm
F	tray width in y direction	50.8 mm
x	number of pockets, x direction	5
y	number of pockets, y direction	12

17. Revision history

Table 27. Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes
PCF85132 v.1	20101123	Product data sheet	-	-

18. Legal information

18.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

18.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

18.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Bare die — All die are tested on compliance with their related technical specifications as stated in this data sheet up to the point of wafer sawing and are handled in accordance with the NXP Semiconductors storage and

transportation conditions. If there are data sheet limits not guaranteed, these will be separately indicated in the data sheet. There are no post-packing tests performed on individual die or wafers.

NXP Semiconductors has no control of third party procedures in the sawing, handling, packing or assembly of the die. Accordingly, NXP Semiconductors assumes no liability for device functionality or performance of the die or systems after third party sawing, handling, packing or assembly of the die. It is the responsibility of the customer to test and qualify their application in which the die is used.

All die sales are conditioned upon and subject to the customer entering into a written die sale agreement with NXP Semiconductors through its legal department.
