#### 74VCX16821

# Low Voltage 20-Bit D-Type Flip-Flops with 3.6V Tolerant Inputs and Outputs

#### **General Description**

The VCX16821 contains twenty non-inverting D-type flipflops with 3-STATE outputs and is intended for bus oriented applications.

The 74VCX16821 is designed for low voltage (1.4V to 3.6V)  $V_{CC}$  applications with I/O compatibility up to 3.6V.

The 74VCX16821 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### **Features**

- 1.4V to 3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
- t<sub>PD</sub>

3.5 ns max for 3.0V to 3.6V  $V_{CC}$ 

- Power-off high impedance inputs and outputs
- Supports live insertion and withdrawal (Note 1)
- $\blacksquare$  Static Drive (I<sub>OH</sub>/I<sub>OL</sub>)

±24 mA @ 3.0V V<sub>CC</sub>

- Uses patented noise/EMI reduction circuitry
- Latch-up performance exceeds 300 mA
- ESD performance:

Human body model > 2000V

Machine model > 200V

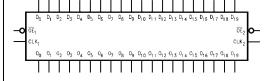

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{\text{OE}}$  should be tied to  $V_{\text{CC}}$  through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

#### **Functional Description**

The VCX16821 contains twenty D-type flip-flops with 3-STATE standard outputs. The device is byte controlled with each byte functioning identically, but independent of each other. Control pins can be shorted together to obtain full 20-bit operation. The following description applies to each byte. The twenty flip-flops will store the state of their individual D-type inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CLK) transition. The 3-STATE standard outputs are controlled by the Output Enable  $(\overline{OE}_n)$  input. When  $\overline{OE}_n$  is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the flip-flops.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: IO Absolute Maximum Rating must be observed.

Note 4: Floating or unused inputs must be held HIGH or LOW.
