# 74VCX16501 Low Voltage 18-Bit Universal Bus Transceivers with 3.6V Tolerant Inputs and Outputs

#### **General Description**

FAIRCHILD

SEMICONDUCTOR

The VCX16501 is an 18-bit universal bus transceiver which combines D-type latches and D-type flip-flops to allow data flow in transparent, latched, and clocked modes.

Data flow in <u>each</u> direction is controlled by output-enable (OEAB and  $\overline{OEBA}$ ), latch-enable (LEAB and LEBA), and clock (CLKAB and CLKBA) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is HIGH. When LEAB is LOW, the A data is latched if CLKAB is held at a HIGH or LOW logic level. If LEAB is LOW, the A bus data is stored in the latch/flip-flop on the LOW-to-HIGH transition of CLKAB. When OEAB is HIGH, the outputs are active. When OEAB is LOW, the outputs are in a high-impedance state.

Data flow for B to A is similar to that of A to B but uses OEBA, LEBA, and CLKBA. The output enables are complementary (OEAB is active HIGH and OEBA is active LOW).

The VCX16501 is designed for low voltage (1.4V to 3.6V)  $V_{CC}$  applications with I/O capability up to 3.6V.

The VCX16501 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Features

- 1.4V to 3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
  t<sub>PD</sub> (A to B, B to A)

2.9 ns max for 3.0V to 3.6V V<sub>CC</sub>

Power-down high impedance inputs and outputs

March 1998

Revised October 2004

- Supports live insertion/withdrawal (Note 1)
- Static Drive (I<sub>OH</sub>/I<sub>OL</sub>)
- $\pm 24$  mA @ 3.0V  $\rm V_{CC}$
- Uses patented noise/EMI reduction circuitry
- Latchup performance exceeds 300 mA
- ESD performance:

Human body model > 2000V

Machine model >200V

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{OEBA}$  should be tied to  $V_{CC}$  through a pull-up resistor and OEAB should be tied to GND through a pull-down resistor; the minimum value of the resistors is determined by the current-sourcing capability of the driver.
