DS8935 LocalTalk Dual Driver/Triple Receiver

National Semiconductor

DS8935 LocalTalk[™] Dual Driver/Triple Receiver

General Description

The DS8935 is a dual driver/triple receiver device optimized to provide a single chip solution for a LocalTalk Interface. The device provides one differential TIA/EIA-422 driver, one TIA/EIA-423 single ended driver, one TIA/EIA-422 receiver and two TIA/EIA-423 receivers, all in a surface mount 16-pin package. This device is electrically similar to the 26LS30 and 26LS32 devices.

The drivers feature $\pm 10V$ common mode range, and the differential driver provides TRI-STATEable outputs. The receivers offer ± 200 mV thresholds over the $\pm 10V$ common mode range.

Connection Diagram

See NS Package Number M20B

The device offers enable circuitry for the differential driver and selectable enabling for the three receivers.

Features

- Single chip solution for LocalTalk port
- Two driver/three receivers per package
- Wide common mode range: ±10V
- ±200 mV receiver sensitivity
- 70 mV typical receiver input hysteresis
- Available in SOIC packaging
- Failsafe receiver for open inputs

Absolute Maximum Ratings (Note 1)

.

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Supply Voltage (V _{CC})	+7V
Supply Voltage (V _{EE})	-7V
Enable Input Voltage (DEN1, RE, RE)	+7V
Driver Input Voltage (D _{IN})	+7V
Driver Output Voltage (Power Off: D _{OUT})	±15V
Receiver Input Voltage (V _{ID} : R _{IN} + - R _{IN} -)	±25V
Receiver Input Voltage (V _{CM} : (R _{IN} + + R _{IN} -)/2)	±25V
Receiver Input Voltage (Input to GND: RIN)	±25V
Receiver Output Voltage (R _{OUT})	+5.5V
Maximum Package Power Dissipation @+25°C	
M Package	1.34W

 Derate M Package 10.7 mW/°C above +25°C

 Storage Temperature Range
 -65°C to +150°C

 Lead Temperature Range (Soldering, 4 Sec.)
 +260°C

This device does not meet 2000V ESD Rating (Note 8)

Switching Characteristics (Notes 4, 5) (Continued)

Over Sup	Over Supply Voltage and Operating Temperature Ranges, unless otherwise specified					
Symbol	Parameter	Conditions	Min	Тур	Max	Units
RECEIVER	CHARACTERISTICS					
t _{HZ}	Disable Time High to Z	C _L = 15 pF		20	75	ns
t _{LZ}	Disable Time Low to Z	(Figures 9, 11)		20	75	ns
t _{zH}	Enable Time Z to High			20	75	ns
t _{ZL}	Enable Time Z to Low			20	75	ns

Note 1: Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of Electrical Characteristics specifies conditions of device operation.

Note 2: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{OD1}, V_{OD1}, $V_{\mbox{OD2}}\xspace$, and $V_{\mbox{SS}}\xspace$.

Note 3: All typicals are given for: V_{CC} = +5.0V, V_{EE} = -5.0V, T_A = +25°C unless otherwise specified.

DRIVER OUTPUT WAVEFORMS

.

The driver configuration on the DS8935 is unique among TIA/EIA-422 devices in that it utilizes –5V V_{EE} supply. A typical TIA/EIA-422 driver uses +5V only and generates signal swings of approximately 0V–5V.

By utilizing V_{EE}, the differential driver is able to generate a much larger differential signal. The typical output voltage is about |4| V, which gives |8| V differentially, thus providing a

much greater noise margin than +5V drivers. See Figure 13. The receiver therefore has a range of +8V to -8V or V_{SS} of 16V (V_{SS} = V_{OD}-V_{OD}_{*}).

Each side of the differential driver operates similar to a TIA/ EIA-423 driver. The output voltages are slightly different due to the loading: the differential driver has differential termination, the single-ended driver is terminated with a resistor to ground.

Typical Application Information (Continued)

UNUSED PINS

Unused driver outputs should be left open. If tied to either ground or supply, the driver may enter an $l_{\rm OS}$ state and consume excessive power. Unused driver inputs should not be left floating as this may lead to unwanted switching which may affect $l_{\rm CC},$ particularly the frequency component. Unused driver inputs should be tied to ground.

Receiver outputs will be in a HIGH state when inputs are open; therefore, outputs should not be tied to ground. It is best to leave unused receiver outputs floating.

RECEIVER FAILSAFE

All three receivers on this device incorporate open input failsafe protection. The differential receiver output will be in a HIGH state when inputs are open, but will be indetermined if inputs are shorted together. Unused differential inputs should be left floating.

Both single-ended receivers (inverting and non-inverting) are biased internally so that an open input will result in a HIGH output. Therefore, these inputs should not be shorted to ground when unused.

BYPASS CAPACITORS

Bypass capacitors are recommended for both V_{CC} and V_{EE} . Noise induced on the supply lines can affect the signal quality of the output; V_{CC} affects the V_{OH} and V_{EE} affects the V_{OL} . Capacitors help reduce the effect on signal quality. A value of 0.1 μF is typically used.

Since this is a power device, it is recommended to use a bypass capacitor for each supply and for each device. Sharing a bypass capacitor between other devices may not be sufficient.

TERMINATION

On a multi-point transmission line which is electrically long, it is advisable to terminate the line at both ends with its characteristic impedance to prevent signal reflection and its associated noise/crosstalk.

A 100 Ω termination resistor is commonly specified by TIA/ EIA-422 for differential signals. The DS8935 is also specified using 140 Ω termination which will result in less power associated with the driver output. The additional resistance is typical of applications requiring EMI filtering on the driver outputs.

TWO-WIRE LocalTalk

The DS8935 is a single chip solution for a LocalTalk interface. A typical application is shown in *Figure 12*.

An alternative implementation of LocalTalk is to only use two wires to communicate. The differential data lines can be transformer-coupled on to a twisted pair medium. See *Figure 14*. The handshake function must then be accomplished in software.

FIGURE 14. Differential Communication, Transformer-Coupled to a Twisted-Pair Line

SINGLE +5V SUPPLY

The DS8935 is derived from the DS3691/92 which could be configured using a single +5V supply ($V_{EE} = 0V$). This device is not specified for this type of operation. However, the device will not be damaged if operated using a single +5V supply.

Both drivers require the –5V supply in order to meet the output voltage levels specified. When the device switches from a positive voltage to the complimentary state, it is pulled toward the V_{EE}level. If that level is 0V, then the complimentary

state will be near 0V instead of V_{EE}. Thus, the output would switch from about 4V to 0V, instead of 4V to -4V. The differential driver will meet TIA/EIA-422, but with a reduced noise margin. The single-ended driver will not meet TIA/EIA-423 without the -5V supply.

The receivers will be functional but may suffer parametrically. The inverting receiver is referenced to V_{EE} therefore, the threshold may shift slightly. The inputs can still vary over the ±10V common mode range.
