# Octal-Channel Ultrasound Front-End with CW Doppler Mixers 

#### Abstract

General Description The MAX2078 octal-channel ultrasound front-end is a fully integrated bipolar, high-density octal-channel ultrasound receiver optimized for low cost, high-channel count, high-performance portable and cart-based ultrasound systems. The easy-to-use IC allows the user to achieve high-end 2D, PW, and CW Doppler (CWD) imaging capability using substantially less space and power. The highly compact imaging receiver lineup, including low-noise amplifier (LNA), variable-gain amplifier (VGA), and anti-alias filter (AAF), achieves an ultra-low 2.4dB noise figure at $\mathrm{RS}_{\mathrm{S}}=\mathrm{RIN}=200 \Omega$ at a very low 64.8 mW per channel power dissipation. The full imaging receiver channel has been optimized for second-harmonic imaging with -64dBFS second-harmonic distortion performance with a 1Vp-p 5MHz output signal. The bipolar front-end has also been optimized for excellent low-velocity PW and color-flow Doppler sensitivity with an exceptional near-carrier SNR of $140 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz offset from a $5 \mathrm{MHz} 1 \mathrm{Vp}-\mathrm{P}$ output clutter signal. A fully integrated high-performance, programmable CWD beamformer is also included. Separate I/Q mixers for each channel are available for optimal CWD sensitivity in high-clutter environments, yielding an impressive near-carrier SNR of $154 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz offset from a 1.25 MHz 200 mV p-p input clutter signal. The MAX2078 octal-channel ultrasound front-end is available in a small $10 \mathrm{~mm} \times 10 \mathrm{~mm}$, 68-pin thin QFN package with an exposed pad and is specified over a $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ temperature range.

| PART | TEMP RANGE | PIN-PACKAGE |
| :---: | :---: | :---: |
| MAX2078CTK + | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 68 Thin QFN-EP* |

+Denotes a lead(Pb)-free/RoHS-compliant package.
*EP = Exposed pad.

- 8 Full Channels of LNA, VGA, AAF, and CWD Mixers in a Small, 10mm x 10mm TQFN Package
- Pin Compatible with MAX2077 with LNA, VGA, and AAF in $10 \mathrm{~mm} \times 10 \mathrm{~mm}$ TQFN Variant
- Ultra-Low Full-Channel Noise Figure of 2.4dB at $R_{\text {IN }}=R_{\text {S }}=200 \Omega$
- Low Output-Referred Noise of $23 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ at 5 MHz , 20 dB Gain, Yielding a Broadband SNR of 68dB** for Excellent Second-Harmonic Imaging
- High Near-Carrier SNR of $140 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz Offset from a $5 \mathrm{MHz}, 1 \mathrm{~V}_{\mathrm{P}-\mathrm{p}}$ Output Signal, and 20 dB of Gain for Excellent Low-Velocity PW and Color-Flow Doppler Sensitivity in a High-Clutter Environment
- Ultra-Low-Power 64.8mW per Full-Channel (LNA, VGA, and AAF) Normal Imaging Mode (234mW per Channel in CWD Mode)
- Selectable Active Input-Impedance Matching of $50 \Omega, 100 \Omega, 200 \Omega$, and $1 \mathrm{k} \Omega$
- Wide Input-Voltage Range of 330 mV P-p in High LNA Gain Mode and 550mVp-p in Low LNA Gain Mode
- Integrated Selectable 3-Pole 9MHz, 10MHz, 15 MHz , and 18 MHz Butterworth AAF
- Fast-Recovery, Low-Power Modes (<2 $\mu$ s)
- Fully Integrated, High Dynamic Range CWD Beamformer with Near-Carrier SNR of $154 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz Offset from a $1.25 \mathrm{MHz}, 200 \mathrm{mV} \mathrm{V}_{\mathrm{P} \text { - }}$ Input Clutter Signal
${ }^{* *}$ When coupled with the MAX1437B ADC.

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

## ABSOLUTE MAXIMUM RATINGS

 $\mathrm{CI}_{-}, \mathrm{CQ}_{-}, \mathrm{VCC}_{C}$, VREF analog and digital control signals must
be applied in this order
Input Differential Voltage .....................................2.0VP-P differential Continuous Power Dissipation ( $\mathrm{T}_{\mathrm{A}}=+70^{\circ} \mathrm{C}$ )
68 -Pin TQFN (derated $40 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $+70^{\circ} \mathrm{C}$ ) .................. 4 W Operating Temperature Range (Note 1A) .............. $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ Junction Temperature ..................................................... $+150^{\circ} \mathrm{C}$

$\theta_{J A}$ (Note 1C, 1D). $+20^{\circ} \mathrm{C} / \mathrm{W}$
Storage Temperature Range ................................ $40^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Lead Temperature (soldering, 10s) ................................. $+300^{\circ} \mathrm{C}$

Note 1A: $T_{C}$ is the temperature on the exposed pad of the package. $T_{A}$ is the ambient temperature of the device and PCB.
Note 1B: Junction temperature $T_{J}=T_{C}+\left(\theta_{J C} \times V_{C C} \times I_{C C}\right)$. This formula can only be used if the component is soldered down to a printed circuit board pad containing multiple ground vias to remove the heat. The junction temperature must not exceed $150^{\circ} \mathrm{C}$.
Note 1C: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a fourlayer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.
Note 1D: Junction temperature $T_{J}=T_{A}+\left(\theta_{J A} \times V_{C C} \times I C C\right)$, assuming there is no heat removal from the exposed pad. The junction temperature must not exceed $150^{\circ} \mathrm{C}$.
Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(Typical Application Circuit, $\mathrm{V}_{\text {REF }}=2.475 \mathrm{~V}$ to $2.525 \mathrm{~V}, \mathrm{~V}_{\mathrm{CC}} 1=3.13 \mathrm{~V}$ to $3.47 \mathrm{~V}, \mathrm{~V}_{\mathrm{CC}} 2=4.5 \mathrm{~V}$ to $5.25 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{GND}}=0 \mathrm{~V}$, $C L P=0, P D=0$, no RF signals applied. Typical values are at $\mathrm{V}_{\mathrm{C}} 1=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{CC}} 2=4.75 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.) (Note 2)

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

## AC ELECTRICAL CHARACTERISTICS—SERIAL PERIPHERAL INTERFACE

(DOUT loaded with 60 pF and $10 \mathrm{M} \Omega$, 2ns rise and fall edges on CLK.)

| PARAMETER | SYMBOL | CONDITIONS | MIN | TYP |
| :--- | :---: | :---: | :---: | :---: |
| MAX | UNITS |  |  |  |
| Clock Speed <br> Time |  |  |  | 10 |
| Mininimum Data-to-Clock Setup <br> Time | tcs |  | 5 | ns |
| Mininimum Clock-to-CS Setup <br> Time | tES |  | 0 | ns |
| $\overline{\text { CS }}$ Positive Mininimum Pulse <br> Width | tew |  | 5 | ns |
| Mininimum Clock Pulse Width | tcW |  | 1 | ns |
| Mininimum $\overline{\text { CS }}$ High to Mixer <br> Clock on | tMIX $\overline{C S}$ |  | 2 | ns |

Note 2: Minimum and maximum limits at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}$ are guaranteed by design, characterization, and/or production test.
Note 3: Noise performance of the device is dependent on the noise contribution from VREF. Use a low-noise supply for $V_{\text {REF }}$.
Note 4: Note that the LVDS CWD LO clocks are DC-coupled. This is to ensure immediate synchronization when the clock is first turned on. An AC-coupled LO is problematic in that the RC time constant associated with the coupling capacitors and the input impedance of the pin causes a period of time (related to the RC time constant) when the DC level on the chip side of the capacitor is outside the acceptable common-mode range and the LO swing does not excede both of the logic thresholds required for proper operation. This problem associated with AC-coupling causes an inability to ensure synchronization among beamforming channels. The LVDS signal is terminated differentially with an external $100 \Omega$ resistor on the board.
Note 5: An external $100 \Omega$ resistor terminates the LVDS differential signal path.
Note 6: Total on-chip power dissipation is calculated as $P_{D I S S}=V_{C C} 1 \times I_{C C} 1+V_{C C} 2 \times I_{C C} 2+V_{R E F} \times I_{\text {REF }}+\left[11 V-\left(I_{11 V} / 4\right) \times 162\right]$ $x_{111}$.
Note 7: This response time does not include the CW output highpass filter. When switching to VGA mode, the CW outputs stop drawing current and the output voltage goes to the rail. If a highpass filter is used, the recovery time may be excessive and a switching network is recommended, as shown in the Applications Information section.
Note 8: See the Ultrasound-Specific IMD3 Specification section.
Note 9: The reference input noise is given for 8 channels, knowing that the reference-noise contributions are correlated in all 8 channels. If more channels are used, the reference noise must be reduced to get the best noise performance.
Note 10: Channel-to-channel gain and phase matching measured on 30 pieces during engineering characterization at room temperature. Each mixer is used as a phase detector and produces a DC voltage in the IQ plane. The phase is given by the angle of the vector drawn on that plane. Multiple channels from multiple parts are compared to each other to produce the phase variation.
Note 11: Voltage gain is measured by subtracting the output-voltage signal from the input-voltage signal. The output-voltage signal is obtained by taking the differential CW I output and summing it in quadrature with the differential CW Q output. The input voltage is defined as the differential voltage applied to the CW input pins.
Note 12: Mixer output-voltage compliance is the range of acceptable voltages allowed on the CW mixer outputs.
Note 13: Transconductance is defined as the quadrature-combined CW differential output current at baseband divided by the mixer's input voltage.

Pin Description

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 1 | IN2 | Channel 2 Input |
| 2 | INC2 | Channel 2 Clamp Input. Connect to a coupling capacitor. See the Typical Application Circuit for details. |
| 3 | ZF3 | Channel 3 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 4 | IN3 | Channel 3 Input |
| 5 | INC3 | Channel 3 Clamp Input. Connect to a coupling capacitor. See the Typical Application Circuit for details. |
| 6 | ZF4 | Channel 4 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 7 | IN4 | Channel 4 Input |
| 8 | INC4 | Channel 4 Clamp Input. Connect to the input coupling capacitor. See the Typical Application Circuit for details. |
| 9, 28,31 | GND | Ground |
| 10 | AG | AC Ground. Connect a low-ESR 1 HF capacitor to ground. |
| 11 | ZF5 | Channel 5 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 12 | IN5 | Channel 5 Input |
| 13 | INC5 | Channel 5 Clamp Input. Connect to a coupling capacitor. See the Typical Application Circuit for details. |
| 14 | ZF6 | Channel 6 Active Impedance Matching Line. AC-couple to source with a 10 nF capacitor. |
| 15 | IN6 | Channel 6 Input |
| 16 | INC6 | Channel 6 Clamp Input. Connect to a coupling capacitor. See the Typical Application Circuit for details. |
| 17 | ZF7 | Channel 7 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 18 | IN7 | Channel 7 Input |
| 19 | INC7 | Channel 7 Clamp Input. Connect to the input coupling capacitor. See the Typical Application Circuit for details. |
| 20 | ZF8 | Channel 8 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 21 | IN8 | Channel 8 Input |
| 22 | INC8 | Channel 8 Clamp Input. Connect to a coupling capacitor. See the Typical Application Circuit for details. |
| $\begin{gathered} 23,33, \\ 53,64 \end{gathered}$ | Vcc2 | 4.75 V Power Supply. Connect to an external 4.75 V power supply. Connect all 4.75 V supply pins together externally and bypass with 100 nF capacitors as close as possible to the pin. |
| 24 | VReF | External 2.5V Reference Supply. Connect to a low-noise power supply. Bypass to GND with a $0.1 \mu \mathrm{~F}$ capacitor as close as possible to the pins. Note that noise performance of the device is dependent on the noise contribution from $V_{\text {REF }}$. Use a low-noise supply for $V_{\text {REF }}$. |
| 25, 44, 63 | Vcc1 | 3.3V Power Supply. Connect to an external 3.3 V power supply. Connect all 3.3 V supply pins together externally and bypass with 100 nF capacitors as close as possible to the pin. |
| 26 | VG+ | VGA Analog Gain Control Differential Input. Set the differential voltage to -3V for minimum gain and to |
| 27 | VG- | +3V for maximum gain. |
| 29 | CLP | CW Low-Power Mode Select Input. Drive CLP high to place CW mixers in low-power mode. |
| 30 | PD | Power-Down Mode Select Input. Set PD to Vcc1 to place the entire device in power-down mode. Drive PD low for normal operation. This mode overrides the standby mode. |
| 32 | DOUT | Serial Port Data Output. Data output for ease of daisy-chain programming. The level is 3.3V CMOS. |
| 34 | OUT8- | Channel 8 Negative Differential Output |
| 35 | OUT8+ | Channel 8 Positive Differential Output |
| 36 | OUT7- | Channel 7 Negative Differential Output |

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 37 | OUT7+ | Channel 7 Positive Differential Output |
| 38 | OUT6- | Channel 6 Negative Differential Output |
| 39 | OUT6+ | Channel 6 Positive Differential Output |
| 40 | OUT5- | Channel 5 Negative Differential Output |
| 41 | OUT5+ | Channel 5 Positive Differential Output |
| 42 | LO- | Differential Local Oscillator Input. LO is divided in the beamformer. |
| 43 | LO+ |  |
| 45 | OUT4- | Channel 4 Negative Differential Output |
| 46 | OUT4+ | Channel 4 Positive Differential Output |
| 47 | OUT3- | Channel 3 Negative Differential Output |
| 48 | OUT3+ | Channel 3 Positive Differential Output |
| 49 | OUT2- | Channel 2 Negative Differential Output |
| 50 | OUT2+ | Channel 2 Positive Differential Output |
| 51 | OUT1- | Channel 1 Negative Differential Output |
| 52 | OUT1+ | Channel 1 Positive Differential Output |
| 54 | CLK | Serial Port Clock Input (Positive Edge Triggered). 3.3V CMOS. Clock input for programming the serial shift registers. |
| 55 | DIN | Serial Port Data Input. 3.3V CMOS. Data input to program the serial shift registers. |
| 56 | $\overline{C S}$ | Serial Port Chip Select Input. 3.3V CMOS. Used to store programming bits in registers, as well as in CW mode, synchronizing all channel phases (on a rising edge). |
| 57 | NP | VGA Standby Mode Select Input. Set NP to 1 to place the entire device in standby mode. Overrides soft channel shutdown in serial shift register, but not general power-down (PD). |
| 58 | V/C | VGA/CW Mode Select Input. Set V/C to a logic-high to enable the VGAs and disable CW mode. Set V/C to a logic-low to enable the CW mixers and disable the VGA mode. |
| 59 | CQ- | 8-Channel CW Negative Quadrature Output. Connect to an external 11V power supply with a $162 \Omega$ external pullup resistor. |
| 60 | CQ+ | 8-Channel CW Positive Quadrature Output. Connect to an external 11V power supply with a $162 \Omega$ external pullup resistor. |
| 61 | $\mathrm{Cl}-$ | 8-Channel CW Negative In-Phase Output. Connect to an external 11V power supply with a $162 \Omega$ external pullup resistor. |
| 62 | $\mathrm{Cl}+$ | 8-Channel CW Positive In-Phase Output. Connect to an external 11V power supply with a $162 \Omega$ external pullup resistor. |
| 65 | ZF1 | Channel 1 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |
| 66 | IN1 | Channel 1 Input |
| 67 | INC1 | Channel 1 Clamp Input. Connect to the input coupling capacitor. See the Typical Application Circuits for details. |
| 68 | ZF2 | Channel 2 Active Impedance Matching Line. AC-couple to source with a 10nF capacitor. |

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

## Detailed Description

The MAX2078 is a high-density, octal-channel ultrasound receiver optimized for low cost, high-channel count, high-performance portable and cart-based ultrasound applications. The integrated octal LNA, VGA, AAF, and programmable CWD beamformer offer a complete multi-specialty, ultrasound receiver solution.
Imaging path dynamic range has been optimized for exceptional second-harmonic performance. The complete imaging receive channel exhibits an exceptional 68dBFS** SNR at 5MHz. The bipolar front-end has also been optimized for exceptionally low near-carrier modulation noise for exceptional low-velocity pulsed and color-flow Doppler sensitivity under high-clutter conditions, achieving an impressive near-carrier SNR of $140 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz offset from a VOUT $=1 \mathrm{VP}-\mathrm{P}, 5 \mathrm{MHz}$ clutter signal.
**When coupled with the MAX1437B ADC.

The MAX2078 also integrates an octal quadrature mixer array and programmable LO phase generators for a complete continuous-wave Doppler (CWD) beamforming solution. Separate mixers for each channel are available for optimal CWD sensitivity, yielding an impressive SNR of $154 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz offset from a $200 \mathrm{mVP}-\mathrm{P}, 1.25 \mathrm{MHz}$ input signal. The LO phase selection for each channel is programmed using a digital serial interface and a single high-frequency clock. The serial interface is designed to allow multiple devices to be easily daisy-chained to minimize program interface wiring. The outputs of the mixers are summed into single I and Q differential current outputs.

Modes of Operation
The MAX2078 requires programming before it can be used. The operating modes are controlled by 47 programming bits. Tables 1 and 2 show the functions of these programming bits.

Table 1. Summary of Programming Bits

| BIT NAME | DESCRIPTION |
| :---: | :--- |
| D40, D41, D42 | Input impedance programming |

# Octal-Channel Ultrasound Front-End with CW Doppler Mixers 

## Low-Noise Amplifier (LNA)

The MAX2078's LNA is optimized for excellent dynamic range and linearity performance characteristics, making it ideal for ultrasound imaging applications. When the LNA is placed in low-gain mode, the input resistance (RIN), being a function of the gain $A(R I N=R F /(1+A))$, increases by a factor of approximately 2. Consequently, the switches that control the feedback resistance (RF) have to be changed. For instance, the $100 \Omega$ mode in high gain becomes the $200 \Omega$ mode in low gain (see Table 2).

## Variable-Gain Amplifier (VGA)

The MAX2078's VGAs are optimized for high linearity, high dynamic range, and low output-noise performance, all of which are critical parameters for ultrasound imaging applications. Each VGA path includes circuitry for adjusting analog gain, as well as an output buffer with differential output ports (OUT_+, OUT_-) for driving ADCs. See the High-Level CW Mixer and Programmable Beamformer Functional Diagram for details.
The VGA gain can be adjusted through the differential gain control input VG+ and VG-. Set the differential gain control input voltage at -3 V for minimum gain and +3 V for maximum gain. The differential analog control commonmode voltage is 1.65 V (typ).

## Overload Recovery

The device is also optimized for quick overload recovery for operation under the large input signal conditions that are typically found in ultrasound input buffer imaging applications. See the Typical Operating Characteristics for an illustration of the rapid recovery time from a trans-mit-related overload.

Octal Continuous-Wave (CW) Mixer The MAX2078 CW mixers are designed using an active double-balanced topology. The mixers achieve high dynamic range and high linearity performance, with exceptionally low thermal and jitter noise, ideal for ultrasound CWD signal reception. The octal quadrature mixer array provides noise performance of $154 \mathrm{dBc} / \mathrm{Hz}$ at 1 kHz offset from a $1.25 \mathrm{MHz}, 200 \mathrm{mV}$ p-p input clutter signal and a two-tone third-order ultrasound-specific intermodulation product of -48.5 dBc (typ). See the Ultrasound-Specific IMD3 Specification section.
The octal array exhibits quadrature and in-phase differential current outputs (CQ+, CQ-, CI+, CI-) to produce the total CWD beamformed signal. The maximum differential current output is typically $3 \mathrm{mAP}-\mathrm{P}$ and the mixeroutput compliance voltage ranges from 4.5 V to 12 V .

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

Each mixer can be programmed to 1 of 16 phases; therefore, 4 bits are required for each channel for programming. Each CW channel can be programmed to an off state by setting bit Di to 1 . The power-down mode (PD) line overrides this soft shutdown.
After the serial shift registers have been programmed, the $\overline{\mathrm{CS}}$ signal, when going high, loads the phase information in the form of 5 bits per channel into the I/Q phase divider/selectors. This presets the dividers, selecting the appropriate mixer phasing. See Table 3 for mixer phase configurations.

## CW Mixer Output Summation

The outputs from the octal-channel mixer array are summed internally to produce the total CWD summed beamformed signal. The octal array produces eight
differential quadrature $(Q)$ outputs and eight differential in-phase (I) outputs. All quadrature and in-phase outputs are summed into single I and $Q$ differential current outputs (CQ+, CQ-, Cl+, Cl-).

## LO Phase Select

The LO phase dividers can be programmed through the shift registers to allow for 16 quadrature phases for a complete CW beamforming solution.

## Synchronization

Figure 1 illustrates the serial programming of the eight individual channels through the serial data port. Note that the serial data can be daisy- chained from one part to another, allowing a single data line to be used to program multiple chips in the system.

## VGA and CW Mixer Operation

During normal operation, the MAX2078 is configured so that either the VGA path is enabled while the mixer array is powered down (VGA mode), or the quadrature mixer array is enabled while the VGA path is powered down (CW mode). For VGA mode, set V/C to a logichigh and for CW mode, set V/C to a logic-low.

Power-Down and Low-Power Mode
The MAX2078 can also be powered down with PD. Set PD to VCC1 for power-down mode. In power-down mode, the device draws a total supply current less than $1 \mu \mathrm{~A}$. Set PD to logic-low for normal operation.
A low-power mode is available to lower the required power for CWD operation. When selected, the complex mixers operate at lower quiescent currents and the total per-channel current is lowered to 34.2 mA . Note that operation in this mode slightly reduces the dynamic performance of the device. Table 4 shows the logic function of the standard operating modes.

## Applications Information

Mode Select Response Time
The mode select response time is the time that the device takes to switch between CW and VGA modes. Figure 2 depicts one possible approach to interfacing the CW outputs to an instrumentation amplifier, which is used to drive an ADC. In this implementation, there are four large-value (in the range of 470 nF to $1 \mu \mathrm{~F}$ ) capacitors between each of the CQ+, CQ-, Cl+, Cl- outputs and the circuitry they are driving. The output of the CW

Figure 2. Typical Example of a CW Mixer's Output Circuit
mixer usually drives the input of an instrumentation amplifier made up of op amps whose input impedance is set by common-mode setting resistors.
There are clearly both a highpass corner and a lowpass corner present in this output network. The lowpass corner is set primarily by the $162 \Omega$ mixer pullup resistors, the series $50 \Omega$ resistors, and the shunt $0.022 \mu \mathrm{~F}$ capacitor. This lowpass corner is used to filter a combination of LO leakage and upper sideband. The highpass corner, however, is of a larger concern since it is dominated by the combination of a $1 \mu \mathrm{~F}$ DC-blocking capacitor and the pair of shunt $31.6 \mathrm{k} \Omega$ resistors.

Table 4. Logic Function of Standard Operating Modes

| PD <br> INPUT | V/C | CLP | VGA | CW <br> MIXER | INTERNAL <br> SWITCH <br> TO VGA | INTERNAL <br> SWITCH <br> TO CW <br> MIXER | 3.3V Vcc <br> CURRENT <br> CONSUMPTION | 5V VCc <br> CURRENT <br> CONSUMPTION | 11V VMIX <br> CURRENT <br> CONSUMPTION |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 0 | 1 | N/A | On | Off | On | Off | 88 mA | 48 mA | 0 |

[^1]
# Octal-Channel Ultrasound Front-End with CW Doppler Mixers 

If drawn, the simplified dominant highpass network would look like Figure 3.
The highpass pole in this case is at $f p=1 /(2 \times$ pi $\times R C)$ $\sim 5 \mathrm{~Hz}$. Note that this low highpass corner frequency is required to filter the downconverted clutter tone, which appears at DC, but not interfere with CWD imaging at frequencies as low as 400 Hz . For example, if one wanted to use CWD down to 400 Hz , then a good choice for the highpass pole would be at least a decade below this $(<40 H z)$ as not to incur rolloff due to the pole. Remember, if the highpass pole is set to 400 Hz , the response is 3 dB down at that corner frequency. The placement of the highpass pole at 5 Hz in the above example is between the DC and 40 Hz limitations just discussed.
The bottom line is that any reasonably sized DC block between the output of the mixer and the instrumentation amplifier poses a significant time constant that slows the mode select switching speed.
An alternative solution to the approach in Figure 2, which enables faster mode select response time, is shown in Figure 4.
In Figure 4, the outputs of the CWD mixers are DC-coupled into the inputs of the instrumentation amplifiers. Therefore, the op amps must be able to accommodate the full compliance range of the mixer outputs, which is a maximum of 11 V when the mixers are disabled, down to the 5V supply of the MAX2078 when the mixers are enabled. The op amps can be powered from 11 V for the high rail and 5 V for the low rail, requiring a 6 V op amp.

## Serial Interface

The MAX2078 is programmed using a serial shift register arrangement. This greatly simplifies the complexity of the program circuitry, reduces the number of IC pins necessary for programming, and reduces the PCB layout complexity. See Table 5 for the programming bit order. The data in (DIN) and data out (DOUT) can be daisy-chained from device to device and all front-ends can run off a single programming clock.
The data can be entered after $\overline{\mathrm{CS}}$ goes low. Once a whole word is entered, $\overline{\mathrm{CS}}$ needs to rise. When programming the part, enter LSB first and MSB last.

## Programming the Beamformer

 During the normal CWD mode, the mixer clock (LO+, LO-) is on and the programming signals (DIN, CLK, $\overline{\mathrm{CS}}$ ) are off $(\overline{\mathrm{CS}}=$ high, CLK $=$ low, and DIN $=$ don't care, but fixed to a high or a low). To start the programming sequence, turn off the mixer clock. Data is shifted into

Figure 3. Simplified Circuit of Highpass Pole

Figure 4. Improved Mode Select Response Time Achieved with DC-Coupled Input to Instrumentation Amplifier
the shift register at a recommended 10 MHz programming rate or 100ns minimum data clock period/time. Assuming a 64-channel CWD receiver, this takes about 30 ms for 5 bits per channel. See Figure 5 for timing details. After the shift registers are programmed, pulling $\overline{\mathrm{CS}}$ high loads the internal counters into I/Q phase divider/selectors with the proper values. The mixer clock needs to be off when this occurs or there may be timing issues between the load line timing and the mixer clock timing. The user turns on the mixer clock to start beamforming. The clock must turn on so that it starts at the beginning of a mixer clock cycle. A narrow glitch on the mixer clock is not acceptable and could cause metastability in the I/Q phase dividers.

#### Abstract

Ultrasound Front-End CWD Beamformer The user provides an LO frequency of 16 MHz to 120 MHz . This high clock frequency requires a differential LVDS input. Note that the LVDS CWD LO clocks are DCcoupled. This is to ensure immediate synchronization when the clock is first turned on. An AC-coupled LO is problematic in that the RC time constant associated with the coupling capacitors and the input impedance of the pin results in a period of time (related to the RC time constant) when the DC level on the chip side of the capacitor is outside the acceptable common-mode range and the LO swing cannot overcome both of the logic thresholds required for proper operation. This problem associated with AC coupling would cause an inability to ensure synchronization among beamforming channels.

The LVDS signal is terminated differentially with an external $100 \Omega$ resistor on the board. The LO input is divided internally by 16 to produce 16 phases at a frequency of 1 MHz to 7.5 MHz . There is one divider per channel. Each channel has a corresponding 5 -bit shift register ( 4 bits for phase programming and 1 bit for channel enable) that is used to program the output phase of the divide-by-16 circuit. The first 4 bits of the shift register are for programming the 16 phases, and the fifth bit can be used to turn on/off each channel individually through the serial bus.

## CW Mixer Output Summation

The maximum differential current output is typically $3 \mathrm{mAp}-\mathrm{p}$ and the mixer output-compliance voltage ranges from 4.5 V to 12 V per mixer channel. The mixer common-mode current in each of the differential mixer outputs is typically 2.83 mA . The total summed current would equal $N \times 2.83 \mathrm{~mA}$ in each of the $162 \Omega$ load resistors (where $N=$ number of channels). In this case, the quiescent output voltage at + VSUM and - VSUM outputs would be $11 \mathrm{~V}-(\mathrm{N} \times 2.83 \mathrm{~mA} \times 162 \Omega)=11 \mathrm{~V}-(8 \times$ $2.83 \mathrm{~mA} \times 162 \Omega)=7.34 \mathrm{~V}$. The voltage swing at each output, with one channel driven at maximum output current (differential $2.8 \mathrm{mAP-p}$ ) while the other channels are not driven, would be $1.4 \mathrm{mAp-p} \times 162 \Omega$ or $226 \mathrm{mVP-p}$ and the differential voltage would be 452 mV P-P. The voltage compliance range is defined as the valid range for + VSUM and -VSUM in this example.

## Active Impedance Matching

To provide exceptional noise-figure characteristics, the input impedance of each amplifier uses a feedback topology for active impedance matching. A feedback resistor of the value $(1+(\mathrm{A} / 2)) \times \mathrm{Rs}$ is added between the inverting input of the amplifier to the output. The input impedance is the feedback resistor ( $\mathrm{ZF}_{\mathrm{F}}$ ) divided by $1+(A / 2)$. The factor of two is due to the gain of the

## Table 6. Noise Figure vs. Source and Input Impedances

| $\mathbf{R S}_{\mathbf{S}}(\boldsymbol{\Omega})$ | RIN $_{\text {IN }} \boldsymbol{\Omega}$ ) | $\mathbf{N F}$ (dB) |
| :---: | :---: | :---: |
| 50 | 50 | 4.5 |
| 100 | 100 | 3.4 |
| 200 | 200 | 2.4 |
| 1000 | 1000 | 2.1 |

amplifier (A) being defined with a differential output. For common input impedances, the internal digitally programmed impedances can be used (see Tables 1 and 2). For other input impedances, program the impedance for external resistor operation, and then use an externally supplied resistor to set the input impedance according to the above formula.

## Noise Figure

The MAX2078 is designed to provide maximum input sensitivity with exceptionally low noise figure. The input active devices are selected for very-low-equivalent input noise voltage and current, optimized for source impedances from $50 \Omega$ to $1000 \Omega$. Additionally, the noise contribution of the matching resistor is effectively divided by $1+(\mathrm{A} / 2)$. Using this scheme, typical noise figure of the amplifier is approximately 2.4 dB for $\mathrm{RIN}=\mathrm{RS}=$ 200』. Table 6 illustrates the noise figure for other input impedances.

## Input Clamp

The MAX2078 includes configurable integrated inputclamping diodes. The diodes are clamped to ground at $\pm 0.8 \mathrm{~V}$. The input-clamping diodes can be used to prevent large transmit signals from overdriving the inputs of the amplifiers. Overdriving the inputs could possibly place charge on the input-coupling capacitor, causing longer transmit overload recovery times. Input signals are AC-coupled to the single-ended inputs IN1-IN8, but are clamped with the INC1-INC8 inputs. See the Typical Application Circuit. If external clamping devices are preferred, simply leave INC1-INC8 unconnected.

## Analog Output Coupling

The differential outputs of the VGA are capable of driving a differential load capacitance to GND at each of the differential outputs of 25 pF , and the differential capacitance across the VGA outputs is $15 \mathrm{pF}, \mathrm{RL}=$ $1 \mathrm{k} \Omega$. The differential outputs have a common-mode bias of approximately 1.73 V . AC-couple these differential outputs if the next stage has a different commonmode input range.

## Octal-Channel Ultrasound Front-End with CW Doppler Mixers

## Ultrasound-Specific IMD3 Specification

Unlike typical communications applications, the two input tones are not equal in magnitude for the ultra-sound-specific IMD3 two-tone specification. In this measurement, $f_{1}$ represents reflections from tissue and $f_{2}$ represents reflections from blood. The latter reflections are typically 25 dB lower in magnitude, and hence the measurement is defined with one input tone 25 dB lower than the other. The IMD3 product of interest ( $f_{1}-\left(f_{2}-f_{1}\right)$ ) presents itself as an undesired Doppler error signal in ultrasound applications (see Figure 6).

## PCB Layout

The pin configuration of the MAX2078 is optimized to facilitate a very compact physical layout of the device and its associated discrete components. A typical application for this device might incorporate several devices in close proximity to handle multiple channels of signal processing.
The exposed pad (EP) of the MAX2078's TQFN-EP package provides a low thermal-resistance path to the die. It is important that the PCB on which the MAX2078 is mounted be designed to conduct heat from the EP. In addition, provide the EP with a low-inductance path to electrical ground. The EP MUST be soldered to a ground plane on the PCB, either directly or through an array of plated via holes.
