

TC5070P/TC5071P/TC5072P 6 DIGIT UNIVERSAL COUNTER

TC5070P/TC5071P/TC5072P are 6-digit universal counter containing 6-digit memory register in addition to functions of up/down counting, data presetting, zero suppress, and latch.

The counted contents are output in BCD and seven segment dynamically stepwise from most significant digit in synchronization with input of SCAN.

The seven-segment output can directly drive the common cathode type LED.

In addition to CARRY and ZERO outputs, these counter are provided with EQUAL output, permitting a wide range of applications such as for measuring instruments, timers, etc.

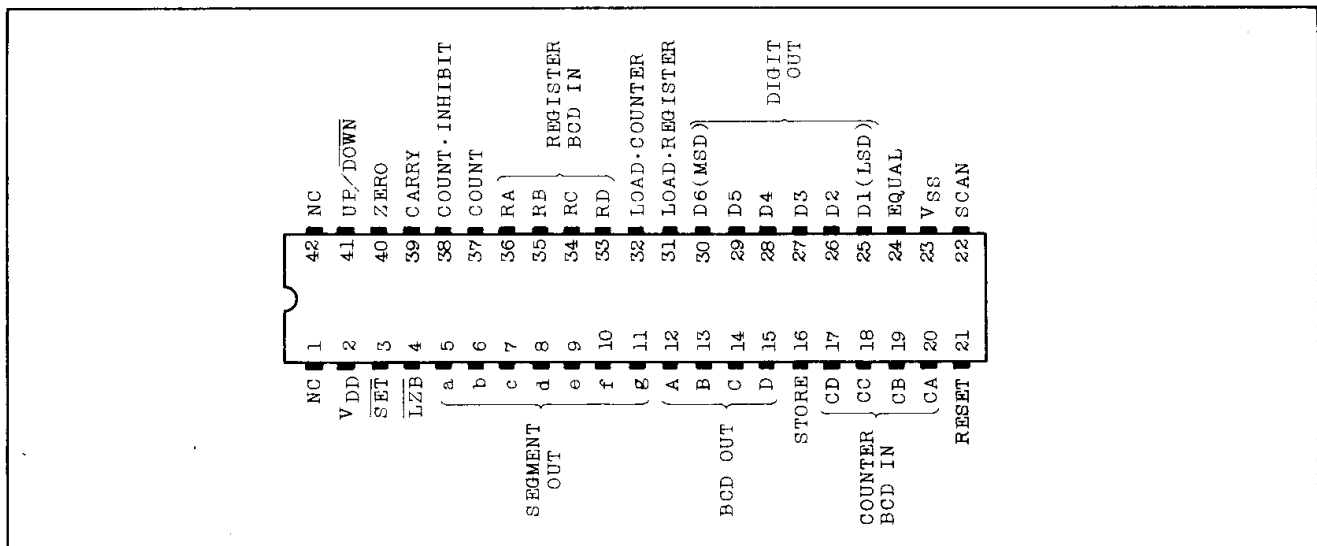

Maximum counting value
TC5070P 999999 COUNTER
TC5071P 995959 TIMER
TC5072P 595999 TIMER

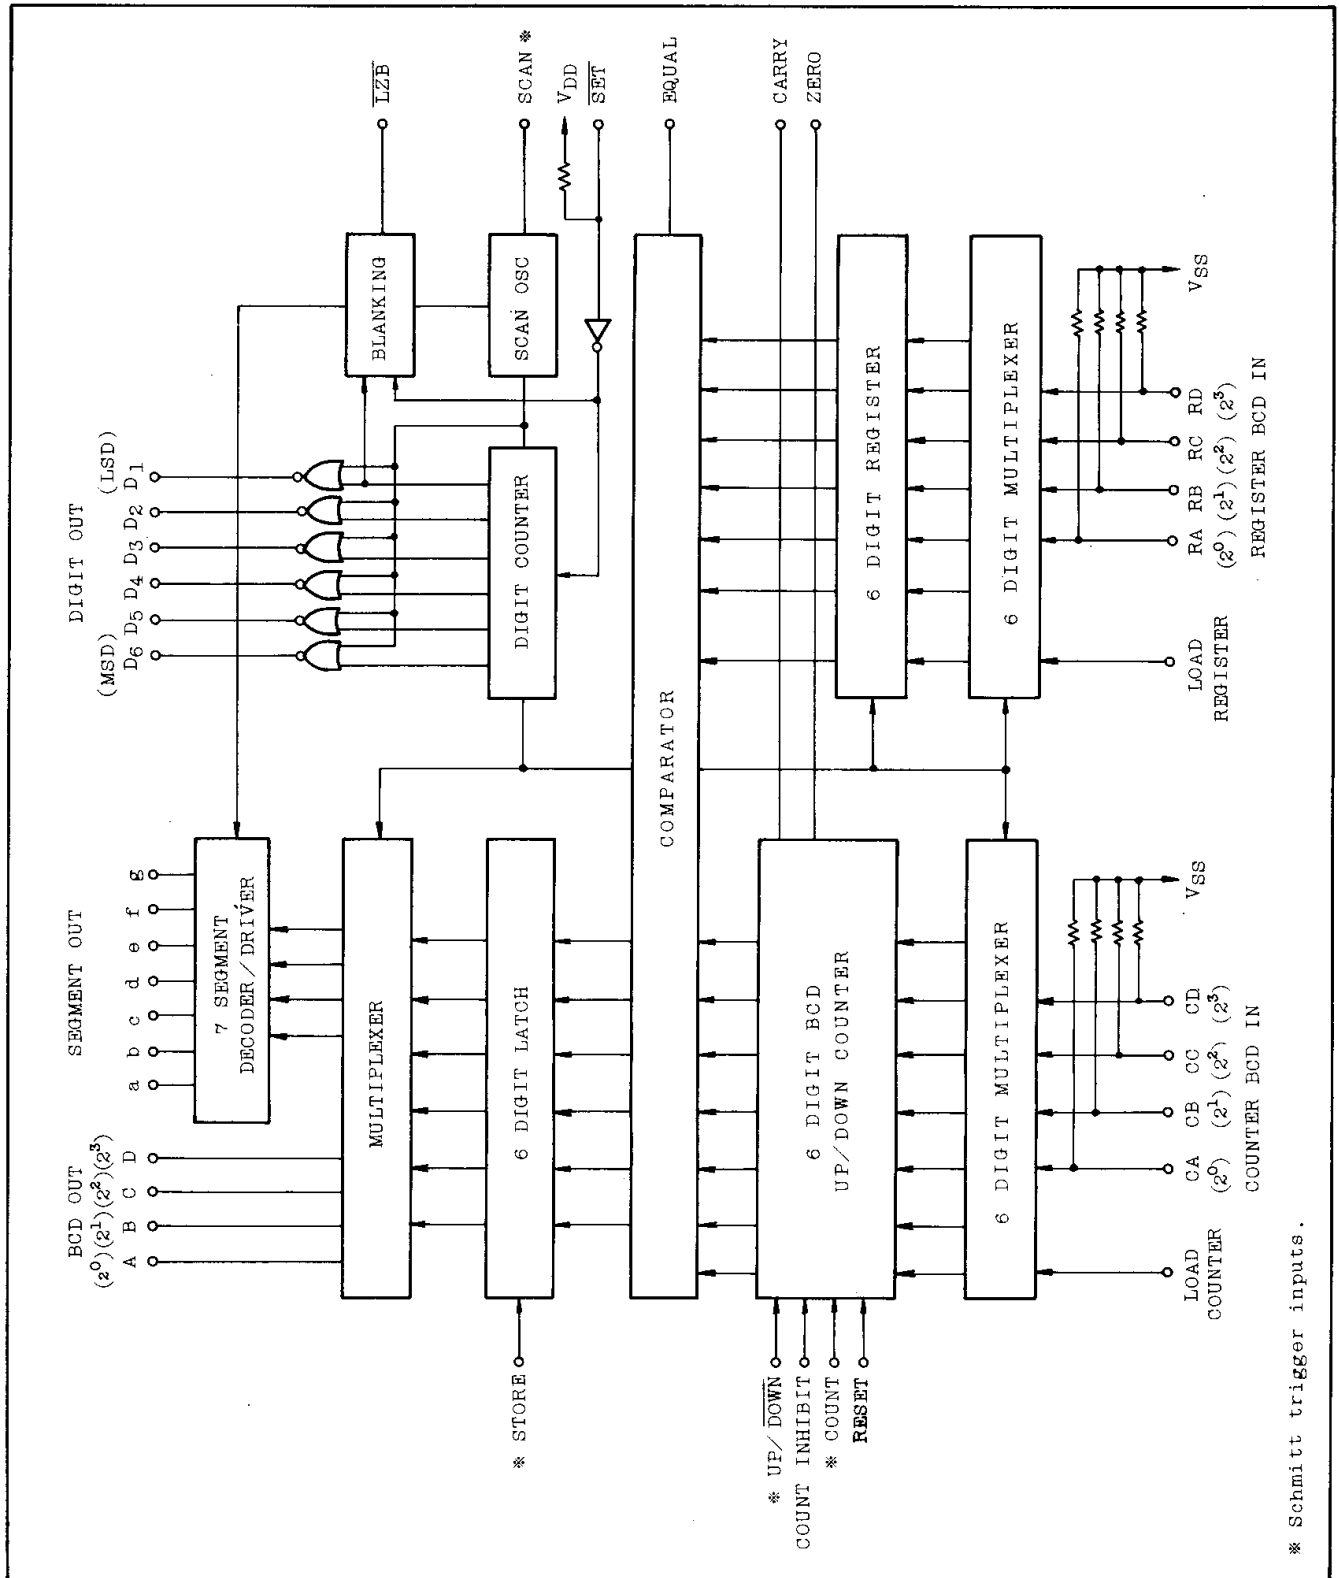

ABSOLUTE MAXIMUM RATINGS

CHARACTERISTIC	SYMBOL	RATING	UNIT

PIN ASSIGNMENT

BLOCK DIAGRAM

TC5070P, TC5071P, TC5072P

DESCRIPTION OF PIN FUNCTION

PIN No.	SYMBOL	FUNCTION	
1	NC	No connection	
2	V _{DD}	V _{DD} power supply (3-8V)	
3	$\overline{\text{SET}}$	At "L" level, the digit counter is reset, and D6 (MSD) only provide. The Segment-out changes to the blanking state. At "H" level, normal display operation.	
4	$\overline{\text{LZB}}$	"H"	No zero blanking
		"L"	Leading zero blanking in the higher order 5 digits.
5	a	Each pin is seven segment output of 6-digit counter. The output is synchronized with the digit-out and is provided stepwise from the most significant digit.	
6	b		
7	c		
8	d		
9	e		
10	f		
11	g	Each pin is BCD output of 6-digit counter. The output is synchronized with the digit-out and is provided stepwise from the most significant digit. When $\overline{\text{SET}}$ input is at "L" level, the most significant digit data is provided.	
12	A		
13	B		
14	C		
15	D	At positive edge of the STORE input, the contents of the counter are latched. The contents of the counter are straight transferred to the multiplexer.	
16	STORE		
17	CD	BCD input at the time when data are preset to the 6-digit counter. (With the LOAD COUNTER input at "H" level.)	
18	CC		
19	CB		
20	CA		
21	RESET	At "H" level, the 6-digit counter is reset, and the contents of the counter become ALL "0". ZERO output become at "H" level.	
22	SCAN	Auto scan oscillator is operated by connecting a capacitor (2000-20000pF) between No.22 (SCAN) and No.23 (V _{SS}) terminals. External scan oscillator may also be used to drive the scan input.	
23	V _{SS}	GND (0V)	

DESCRIPTION OF PIN FUNCTION (Cont'd)

PIN No.	SYMBOL	FUNCTION	
24	EQUAL	When the contents of the 6-digit register set by the input of RA, RB, RC, and RD coincide with the contents of 6-digit counter, EQUAL output is provided at "H" level. Even if both the contents coincide each other during setting by the inputs of LOAD REGISTER and LOAD COUNTER, the output is inhibited and "L" level remains unchanged.	
25	D1 (LSD)	These are the outputs to display the digits of segment out and BCD-out. When SET input reaches "L" level, the digit counter is reset and D6 (MSD) only is provided. When SET input rises at "H" level, the output is provided in the order of D5, D4...in synchronization with the SCAN clock.	
26	D2		
27	D3		
28	D4		
29	D5		
30	D6 (MSD)		
31	LOAD-REGISTER (LOAD-R)	"H"	RA ~ RD input is set to 6-digit register.
		"L"	Write operation to the register is inhibited.
32	LOAD-COUNTER (LOAD-C)	"H"	CA ~ CD input is preset to the 6-digit counter.
		"L"	Write operation to the counter is inhibited.
33	RD	BCD input at the time when the data are set to the 6-digit register. (With the LOAD REGISTER input at "H" level.)	
34	RC		
35	RB		
36	RA		
37	COUNT	Clock input of 6-digit counter (Counting at the positive edge of clock)	
38	COUNT-INHIBIT (C-INH)	"H"	No counting
		"L"	Counting
39	CARRY	When the contents of counter have become "000000" at time of up-counting, CARRY output is provided at "H" level during this time from rise to fall of COUNT input. When the contents of counter have become "999999" (for TC5070P), "995959" (for TC5071P), and "595999" (for TC5072P) at time of down-counting, CARRY output is also provided at "H" level during this time from rise and fall of COUNT input.	
40	ZERO	When the contents of counter have become "00000", ZERO is provided at "H" level. During presetting by the LOAD COUNTER input, output operation is inhibited and "L" level remains unchanged.	
41	UP/DOWN	"H"	Up count.
		"L"	Down count.
42	NC	No connection.	

TIMING CHART

6 DIGIT COUNTER TIMING CHART (TC5070P); LOAD·C, LOAD·R = "L"

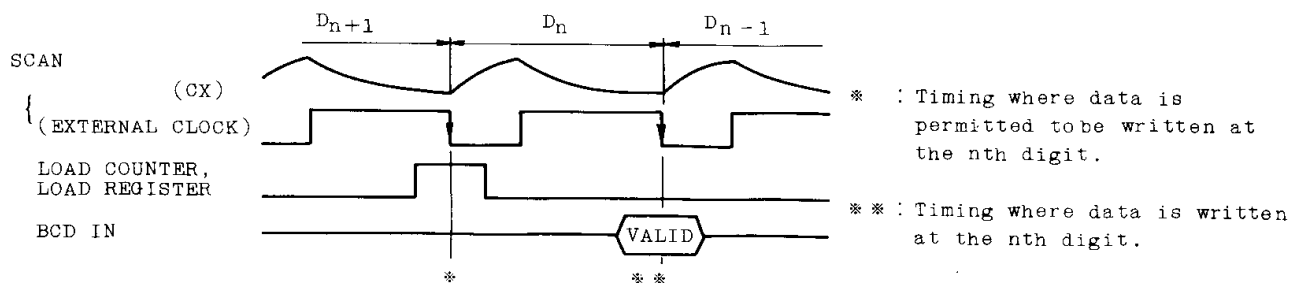

* Register value is preset to 999998.

DIGIT COUNTER TIMING CHART

HZ : High impedance. (Segment driver off.)

LOAD REGISTER, LOAD COUNTER TIMING CHART

OPERATING CONSIDERATION

1. COUNTER OPERATION

Counting is stepped by the rise of clock when the clock is added to COUNT input at state of the inputs of LOAD·C, C·INH, and RESET at "L" level. At time of up-counting, CARRY and ZERO outputs are "H" level at "000000", and at time of down-counting, CARRY output is at "H" level at "999999" (for TC5070P), "995959" (for TC5071P), and "595999" (for TC5072P).

When CARRY output is at "H" level, CARRY output remain at "H" level until COUNT input falls, even if RESET and LOAD·C inputs are changed to "H" level.

For COUNT and UP/DOWN inputs is shaped schmitt trigger, COUNT and UP/DOWN inputs rarely miscounts if waveform is not sharp.

2. COMPARATOR OPERATION

EQUAL output is provided at "H" level, when the contents of the counter coincide with the comparator value set by LOAD·R input. However, even if they coincide each other during setting by LOAD·C and LOAD·R input, output operation is inhibited and "L" level remains unchanged.

3. LOAD COUNTER AND LOAD REGISTER OPERATIONS

When the data required to preset the counter or when the comparing value is required to set to the register, such operation is made by LOAD·C and LOAD·R input. The presetting of data to the counter is acquired by setting LOAD·C input to "H" level, synchronizing CA~CD input with the digit counter, and setting the digits one after another. For the purpose, the external circuits are required for timing of D6~D1 output with CA~CD input. The comparator value can be set to the register in the same way. Load register operation is independently of counting operation; therefore, even during setting of the data to the register, counting can be performed. (See an example of input setting circuits.)

(Note) that normal operation is not acquired when the data exceeding the maximum counting value (for each digit) shown on page 1 for the individual items are set to the counter and register.

4. LATCH OPERATION

At STORE input is at "L" level, the contents of counter are straight transferred to the multiplexer, and the output indicates the contents of counter.

At STORE input is at "H" level, the indicating output remains unchanged although the count varies for the contents of counter are latched at the positive edge of

OPERATING CONSIDERATION (Cont'd)

STORE input. When STORE is turned to "L" level, the contents of counter at that time are provided. STORE input shape schmitt trigger.

5. DISPLAY OPERATION

At $\overline{\text{LZB}}$ input is at "L" level, the higher order 5 digits of SEGMENT-OUT output are changed to the state of leading zero blanking.

At "H" level, the function of leading zero blanking is released.

At $\overline{\text{SET}}$ input is at "L" level, the SEGMENT-OUT output is changed to the state of blanking, and the digit counter is reset, and D6 (MSD) only is provided. At that time, the BCD-OUT output provided the data of the 6th digit. At "H" level, the DIGIT-OUT output provided in the order of D6, D5, D4, ... in synchronization with SCAN, and SEGMENT-OUT and CD-OUT output are also provided in synchronization.

Segment Display Format (Common Cathod type LED)

0	1	2	3	4	5	6	7	8	9	10~15
0	1	2	3	4	5	6	7	8	9	E

6. SCANNING OPERATION

AUTO SCAN operation can be performed by inserting a capacitor between the terminal SCAN and the terminal VSS. By adding an external clock to the terminal SCAN, MANUAL SCAN operation can be performed.

SCAN OSC actuates the digit counter, and at the AUTO SCAN operation, the digit blanking is applied to each DIGIT OUT for the $T/150$ period of one cycle (T) of SCAN OSC, therefore, can be prevented overlap of each DIGIT OUT. One cycle of DIGIT OUT is equal to 6 cycles of SCAN OSC.

SCAN signal synchronize with data signal setting by the LOAD REGISTER and/or LOAD COUNTER inputs. An external capacitor of 2000 to 20000pF is required for SCAN (CX).

(Note) BCD-OUT output may involve some hazards at the change of COUNT input and DIGIT-OUT output; However, such hazards do not hinder operation because they occur during the blanking hours for DIGIT-OUT and SEGMENT-OUT output.
