

Ultra-Fast Precision TTL Comparator

General Description

The Maxim MXL1016 (10ns, typ) high-speed, complementary-output comparator is designed specifically to interface directly to TTL logic while operating from either a dual $\pm 5V$ supply or a single +5V supply.

The MXL1016 remains stable with the outputs in the active region, which greatly reduces output instability common with slow-moving input signals. In addition, an output latch (LE) is provided.

For lower-power, higher-performance comparators, see the MAX912/MAX913 dual/single comparators data sheet. The MAX913 is an improved plug-in replacement for the MXL1016 and the MAX912 is the dual equivalent to the MAX913.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS (continued)

(V+ = 5V, V- = -5V, V_{OUT(Q)} = 1.4V, V_{LE} = 0V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 1)

Note 1: All specifications are 100% tested at T_A = +25°C, unless otherwise noted. Specification limits over temperature (T_A = T_{MIN} to T_{MAX}) are guaranteed by design.

Note 2: Input offset voltage is defined as the average of the two input offset voltages, measured by forcing first one output, then the other to 1.4V. Input offset current is defined in the same way.

Note 3: Input bias current (I_B) is defined as the average of the two input currents.

Note 4: Supply currents are measured with V_{OUT} (Q) driven to both V_{OH} and V_{OL} (not 1.4V).

Note 5: t_{PD} and Δt_{PD} cannot be measured in automatic handling equipment with low values of overdrive. Characterization and correlation tests have shown that t_{PD} and Δt_{PD} limits can be guaranteed by design. Electrical Characteristic DC tests are performed to guarantee that all internal bias conditions are correct. For low overdrive conditions, V_{OS} is added to overdrive.

Note 6: Input latch setup time, t_{SU}, is the interval in which the input signal must be stable prior to asserting the latch signal. The hold time, t_H, is the interval after the latch is asserted in which the input signal must be stable.
