## Precise Call Progress and Special Information Tone Generator

## Features

- Precise detection of call progress tones
- Linear (analog) input
- Digital (CMOS compatible), tri-state outputs
- 22-pin DIP and 20-pin SOIC
- Single supply 3 to 5 volt (low power CMOS)
- Inexpensive 3.58 MHz crystal time base
- Wide dynamic range ( 30 dB )
- Lower power consumption (power-down mode)
- 425 Hz detection
- Special Information Tone (SIT) Detection

## Applications

- Automatic dialers
- Dialing modems
- Traffic measurement equipment
- Test equipment
- Service evaluation
- Billing systems

## Description

The M-985-01 is an integrated circuit precise tone detector for call progress and special information tones (SIT), as defined by CCITT.
The use of integrated circuit techniques allows the M-985-01 to pack the eight filters for call progress detection into a single 22 -pin DIP or a 20 -pin SOIC. A 3.58 MHz crystal-controlled time base guarantees accuracy and repeatability.
The M-985-01 combines the call progress detection of the M-982-02 and the SIT detection of the M-984-02. It has an operating voltage range down to 3 V . It has low power consumption under normal operating conditions. A power down (PD) feature is provided to further reduce power consumption when inactive.

Ordering Information

| Part \# | Description |
| :--- | :--- |
| M-985-01P | 22-pin plastic DIP |
| M-985-01S | 20-pin plastic SOIC |
| M-985-01T | 20-pin plastic SOIC,Tape and Reel |

## Pin Diagram

## Block Diagram

## Absolute Maximum Ratings

| Storage Temperature | -40 to $150^{\circ} \mathrm{C}$ |
| :--- | :---: |
| Operating Ambient Temperature | -40 to $85^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{DD}}$ | 7 V |
| Input Voltage on SIGIN | $\mathrm{V}_{\text {SS }}-6.5$ to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| Input Voltages (except SIGIN) | $\mathrm{V}_{S S}-0.3$ to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| Lead Soldering Temperature | $260^{\circ} \mathrm{C}$ for 5 seconds |

Exceeding these ratings may permanently damage the $\mathrm{M}-985-01$.

Absolute Maximum Ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this data sheet is not implied. Exposure of the device to the absolute maximum ratings for an extended period may degrade the device and effect its reliability.

| Operation |  |  | $\mathrm{R}_{\mathrm{L}}=100 \mathrm{k} \Omega$ | - | 250 | ns |  |

Unless otherwise noted, $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{SS}}=5 \mathrm{~V}, \mathrm{Ta}=25^{\circ} \mathrm{C}, \mathrm{PD}$ at logical low state, and $\overline{\mathrm{XRANGE}}$ at a logical high state. Power levels are in dBm referenced to 600 ohm. DC voltages are referenced to $\mathrm{V}_{\mathrm{SS}}$.
Notes:

1. Per tone.
2. See Table 4 for detection/rejection frequencies.

## Call Progress Tone Detection

Call progress tones are audible tones sent from switching systems to calling parties to show the status of calls. Calling parties can identify the success of a call placed by what is heard after dialing. The type of tone used and its timing vary from system to system, and though intended for human ears these signals can provide valuable information for automated calling systems.
The M-985-01 contains five signal detectors sensitive to the frequencies often used for these progress tones.

Electronic equipment monitoring the OUTn outputs of the M-985-01 can determine the nature of signals present by measuring their duty cycle. See Mechanical Dimensions for a diagram of a circuit that could be used to permit a microcomputer to directly monitor tones on the telephone line. Much of the character of the progress tones is in their duty cycle or cadence (sometimes referred to as interruption rate). This information, coupled with level and frequency indication from the M -985-01, can be used to decide what progress tones have been encountered.

## Pin Functions

| Pin | Function |
| :--- | :--- |
| OUT 1 | Active high tri-state output, per Truth Table. |
| OUT 2 | Active high tri-state output, per Truth Table. |
| OUT 3 | Active high tri-state output, per Truth Table |
| OUT 4 | Active high tri-state output, per Truth Table |
| D425 | Active high tri-state output, indicates 425 Hz detection. |
| EN | Active high enabled, when low drives STROBE low. |
| OE | Active high input. When low tri-states OUT n pins. |
| SIGIN | Analog signal input (internally capacitive coupled). |
| STROBE | Active high output, indicates valid OUT n or D425 |
| VDD | Most positive power supply input pin. |
| VREF | Internally generated mid-power supply voltage (output) |
| V SS | Most negative power supply input pin. |
| X358 | Buffered oscillator output (3.58 MHz). |
| XIN | Crystal oscillator or digital clock input. |
| XOUT | Crystal oscillator output. Used only with a crystal. Use <br> X358 when clock output signal is required. |
| XRANGE | Active low input. Adds 10 dB of gain to input stage. |
| MODE | Selects 400/620 Hz detector frequency, 400 Hz when <br> connected to V $_{\text {SS }}$, 620 Hz when open. |
| PD | Power down operation, logic high inhibits internal <br> clock. Internal pulldown resistor. |
| MODE2 | Tie high (V ${ }_{\text {DD }}$ for normal operation. Tie low or leave <br> open to emulate M-982 operation. |

For example, dial tones shown in absolute Maximum Ratings Table on page 3, are usually "on" continuously and last until the first dial digit is received by the switching system. Line Busy, on the other hand, is turned off and on at a rate of 1 Hz with a $50 \%$ duty cycle, or an interruption rate of 60 times per minute ( 60 IPM). The tones can be distinguished in this way. It should be noted that while such techniques will usually be effective, there are some circumstances in which the M-98501 cannot be accurately used. Examples include situations where ringback tone may be short or not even encountered. Ringback may be provided at ringing voltage frequency ( 20 or 30 Hz ) with some harmonics and may not fall in the detect range, and speech or other strong noise may obscure tones making cadence measurement difficult.
Standards exist and should be consulted for your particular application. In North America AT\&Ts "Notes on the Network" or EIA's RS-464 PBX standard should be reviewed.
In Europe tone plans may vary with locale, in which case the CEPT administration in each country must be consulted. Outside these areas, national PTT organizations can provide information on the systems within their borders.

## Truth Table

| Signal Present (fo) | Mode | OUT 1 | OUT 2 | OUT 3 | OUT 4 | D425 | Strobe | PD | OE | EN |

Clare, Inc. makes no representations or warranties with respect to the accuracy or completeness of the contents of this publication and reserves the right to make changes to specifications and product descriptions at any time without notice. Neither circuit patent licenses nor indemnity are expressed or implied. Except as set forth in Clare's Standard Terms and Conditions of Sale, Clare, Inc. assumes no liability whatsoever, and disclaims any express or implied warranty, relating to its products including, but not limited to, the implied warranty of merchantability, fitness for a particular purpose, or infringement of any intellectual property right.

The products described in this document are not designed, intended, authorized or warranted for use as components in systems intended for surgical implant into the body, or in other applications intended to support or sustain life, or where malfunction of Clare's product may result in direct physical harm, injury, or death to a person or severe property or environmental damage. Clare, Inc. reserves the right to discontinue or make changes to its products at any time without notice.
