AMC7150

1.5A POWER LED DRIVER

DESCRIPTION

AMC7150 is a PWM power LED driver IC. The driving current from few milliamps up to 1.5A. It allows high brightness power LED operating at high efficiency from 4Vdc to 40Vdc. Up to 200KHz external controlled operation frequency. External resistor controlled the maximum output current to single LED or a LED string.

FEATURES

- **Only 5 external components required.**
- **Output driving peak current up to 1.5A.**
- **4V ~ 40V wide operation voltage range.**
- **ESD protection HBM 2KV**
- **TO-252 5-pin power package.**

TYPICAL APPLICATION
APPLICATIONS

- **DC/DC LED driver**
- **Automotive Lighting**
- **Decorative Lighting**
- **MR16**

ORDER INFORMATION

Current Sense Voltage ($V_{CC} - V_{CS}$)	**DL**	TO-252
		5-pin
310 ~ 350mV		AMC7150DLFT
Note: 1. All surface-mount packages are available in Tape & Reel. Append the letter "T" to part number (i.e. AMC7150DLFT). 2. The letter "F" is marked for Lead Free process.		

POWER DISSIPATION TABLE

Package	θ_{JA} (°C W)	Derating factor (mW/°C) $T_A \geqq 25\,^{o}C$	$T_A \leqq 25\,°C$ Power rating (mW)	$T_A = 70°C$ Power rating (mW)	$T_A = 85°C$ Power rating (mW)
DLF	80	12.5	1560	1000	812

Note :

Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$.

P_D: Power Dissipation, T_A: Ambient temperature, θ_{JA}: Thermal Resistance-Junction to Ambient

The θ_{JA} numbers are guidelines for the thermal performance of the device/PC-board system.

All of the above assume no ambient airflow.

PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
1	VCC	Input Voltage 4V ~ 40V
2	CS	Peak current senses pin.
3	GND	Ground
4	OUT	Driver output pin.
5	OSC	Oscillator timing capacitor.

ABSOLUTE MAXIMUM RATINGS

Input Voltage, VCC	-0.3V to 40V
Output Voltage, OUT	-0.3V to 40V
Maximum Junction Temperature, T_J	150°C
Storage Temperature Range	-40°C to 150°C
Lead Temperature (soldering, 10 seconds)	260°C

Note:
  Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground.
  Currents are positive into, negative out of the specified terminal.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Unit
Supply Voltage	VCC	4		40	V
Output current	I_{OUT}			1.5	A
Operating free-air temperature range	Ta	-40		85	°C

ELECTRICAL CHARACTERISTICS

VCC=5V, T_A=25°C. (Unless otherwise noted)

Parameter	Symbol	Condition	Min	Typ	Max	Unit	Apply Pin
Supply Current	I_{CC}	VCC=4~40V			4	mA	VCC
Output Drop-out Voltage	V_{DP}	I_{OUT}=1A, V_{CS}-V_{OUT}		1	1.31	V	OUT
Output Off Current	I_{OFF}	V_{CS}-V_{OUT}= 40V		200	300	µA	OUT
Current Sense Voltage	V_{CC}-V_{CS}		310	330	350	mV	CS
Maximum duty cycle	T_{DC}	V_{CS}=VCC		85		%	OSC
OSC Charge Current	I_{CH}			35		uA	OSC

ADDtek

Low Voltage DC/DC Application

The AMC7150 was designed for power LED driving application. Only 5 external components were required for low voltage application. Fig.1 shows the typical application circuit for input voltage range from 4V to 40V. Buck power conversion topology was used and total forward voltage (at expecting current) of the LED string should lower than supply voltage by 1.6V at least.
Input Bypass Capacitor

The input by-pass capacitor C_{IN} holds the input voltage and filters out the switching noise of AMC7150.

Flywheel Diode

The fast recovery diode was recommended for flywheel diode D_F. This is because the high reverse recovery current will cause the voltage drop across Rsense being higher than 330mV, and consequently the switch will be turned off which has just been turned on.

LED Driving Current

The peak current I_{PK} flow though LEDs was decided by:

$$I_{PK} = \frac{330mV}{Rsense}$$

The average current on LEDs was determined by the peak-to-peak ripple current that was decided by inductor L. Assume the target average current 550mA on LEDs and ripple current 100mA then the Rsense should be:

$$Rsense = \frac{330mV}{550mA + 0.5 \cdot 100mA} = 0.55\Omega$$

The Rsense value should higher than 200mΩ so that driving current won't over the recommended maximum driving current 1.5A.

Inductor

     The Inductor L stores energy during switch turn-on period and discharge driving current to LEDs via flywheel diode while switch turn-off. In order to reduce the current ripple on LEDs, the L value should high enough to keep the system working at continuous-conduction mode that inductor current won't fall to zero.

     Since in steady-state operation the waveform must repeat from one time period to the next, the integral of the inductor voltage v_L over one time period must be zero:

$$\int_0^{T_s} v_L dt = \int_0^{t_{ON}} v_L dt + \int_{t_{ON}}^{T_s} v_L dt = 0 \quad \text{Where} \quad T_s = t_{ON} + t_{OFF}$$

Therefore

$$\frac{t_{ON}}{t_{OFF}} = \frac{V_{LED} + V_F}{V_{CC} - V_{Rsense} - V_{SAT} - V_{LED}}$$

Where, V_{LED} is the total forward voltage (at expecting current) of the LED string, V_F is the forward voltage of the flywheel diode D_F, V_{Rsense} is the peak value of the voltage drop across Rsense which is 300mV, and V_{SAT} is the saturation voltage of the switch which has a typical value of 1V.

     Since the operation frequency f is determined by choosing appropriate value for timing capacitor C_T, the switch turn-on time can also be known by
$$t_{ON} = D \cdot T_s = \frac{D}{f} \quad \text{Where} \quad D(Dutycycle) = \frac{t_{ON}}{t_{ON} + t_{OFF}}$$

With knowledge of the peak switch current and switch on time, the value of inductance can be calculated.

$$L = \frac{V_{CC} - V_{Rsense} - V_{SAT} - V_{LED}}{I_{PK}} \cdot t_{ON}$$
