of frame (SOF), end of frame (EOF), start of line (SOL) and end of line (EOL) sequences to generate the H-SYNC and V-SYNC signals. Output LVTTTL clock (up to 52 MHz) is transmitted in parallel with data. Input and Output data are rising edge strobe. This chipset is an ideal means to link mobile camera modules to baseband processors. In order to minimize static current consumption, it is possible to shut down the device when the interface is not being used by a power-down (EN) pin that reduces to 10 μA the Maximum Current Consumption making this device ideal for portable applications like Mobile Phone, Portable Battery Equipment.

Two dedicated I²C lines are provided to translate bidirectional controls from camera and μC devices. The STCCP27 is offered in a μTFBGA package to optimize PCB space.

All inputs and outputs are equipped with protection circuits against static discharge, giving them ESD immunity from transient excess voltage. The STCCP27 is characterized for operation over the commercial temperature range -40°C to 85°C.

DESCRIPTION

The STCCP27 receiver converts the SubLVDS clock/datastream (up to 416 Mbps throughput bandwidth) back into parallel 8 bits of CMOS/LVTTL. The device recognizes the CCP 32bit start
