

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

## General Description

The MAX5132/MAX5133 low-power, 13-bit, voltage-output digital-to-analog converters (DACs) feature an internal precision bandgap reference and output amplifier.

The MAX5132 operates on a single +5V supply with an internal reference of +2.5V and offers a configurable output amplifier. If necessary, the user can override the on-chip, <math><10\text{ppm}/^\circ\text{C}</math> voltage reference with an external reference. The MAX5133 has the same features as the MAX5132 but operates from a single +3V supply and has an internal +1.25V precision reference. The user-accessible inverting input and output of the amplifier allows specific gain configurations, remote sensing, and high output drive capability for a wide range of force/sense applications. Both devices draw only 500 $\mu\text{A}$  of supply current, which reduces to 3 $\mu\text{A}$  in power-down mode. In addition, their power-up reset feature allows for a user-selectable initial output state of either 0V or mid-scale and reduces output glitches during power-up.

The serial interface is compatible with SPI™, QSPI™, and MICROWIRE™, which makes the MAX5132/MAX5133 suitable for cascading multiple devices. Each DAC has a double-buffered input organized as an input register followed by a DAC register. A 16-bit shift register loads data into the input register. The DAC register may be updated independently or simultaneously with the input register.

Both devices are available in a 16-pin QSOP package and are specified for the extended-industrial (-40°C to +85°C) operating temperature range. For pin-compatible 14-bit upgrades, see the MAX5171/MAX5173 data sheet; for pin-compatible 12-bit versions, see the MAX5122/MAX5123 data sheet.

## Applications

Industrial Process Control  
Automatic Test Equipment (ATE)  
Digital Offset and Gain Adjustment  
Motion Control  
Microprocessor-Controlled Systems

SPI and QSPI are trademarks of Motorola, Inc.  
MICROWIRE is a trademark of National Semiconductor Corp.

## Features

- ◆ Single-Supply Operation
  - +5V (MAX5132)
  - +3V (MAX5133)
- ◆ Built-In 10ppm/°C max Precision Bandgap Reference
  - +2.5V (MAX5132)
  - +1.25V (MAX5133)
- ◆ SPI/QSPI/MICROWIRE-Compatible, 3-Wire Serial Interface
- ◆ Pin-Programmable Shutdown-Mode and Power-Up Reset (0V or Midscale Output Voltage)
- ◆ Buffered Output Capable of Driving 5k $\Omega$  || 100pF or 4–20mA Loads
- ◆ Space-Saving 16-Pin QSOP Package
- ◆ Pin-Compatible Upgrades for the 12-Bit MAX5122/MAX5123
- ◆ Pin-Compatible 14-Bit Upgrades Available (MAX5171/MAX5173)

## Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE	INL (LSB)
MAX5132AE4EE	-40°C to +85°C	16 QSOP	$\pm 0.5$
MAX5132BE4EE	-40°C to +85°C	16 QSOP	$\pm 1$
MAX5133AE4EE	-40°C to +85°C	16 QSOP	$\pm 1$
MAX5133BE4EE	-40°C to +85°C	16 QSOP	$\pm 2$

## Pin Configuration

MAX5132/MAX5133

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

## ABSOLUTE MAXIMUM RATINGS

V <sub>DD</sub> to AGND, DGND .....	-0.3V to +6V	Maximum Current into Any Pin.....	50mA
AGND to DGND.....	-0.3V to +0.3V	Continuous Power Dissipation (T <sub>A</sub> = +70°C)	
Digital Inputs to DGND.....	-0.3V to +6V	16-Pin QSOP (derate 8.00mW/°C above +70°C) .....	667mW
Digital Outputs (DO <sub>UT</sub> , UPO) to DGND .....	-0.3V to (V <sub>DD</sub> + 0.3V)	Operating Temperature Range .....	-40°C to +85°C
FB, OUT to AGND .....	-0.3V to (V <sub>DD</sub> + 0.3V)	Storage Temperature Range .....	-65°C to +150°C
REF, REFADJ to AGND .....	-0.3V to (V <sub>DD</sub> + 0.3V)	Lead Temperature (soldering, 10sec) .....	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Pin Description

MAX5132/MAX5133

PIN	NAME	FUNCTION
1	FB	Amplifier Inverting Sense Input (Analog Input)
2	OUT	Analog Output Voltage. High impedance if part is in shutdown.
3	RSTVAL	Reset Value Input (Digital Input) 1: Connect to V <sub>DD</sub> to select midscale as the output reset value. 0: Connect to DGND to select 0V as the output reset value.
4	$\overline{\text{PDL}}$	Power-Down Lockout (Digital Input). 1: Normal operation. 0: Disallows shutdown (device cannot be powered down).
5	$\overline{\text{CLR}}$	Reset DAC Input (Digital Input). Clears the DAC to its predetermined (RSTVAL) output state. Clearing the DAC will cause it to exit a software shutdown state.
6	$\overline{\text{CS}}$	Active-Low Chip-Select Input (Digital Input)
7	DIN	Serial Data Input. Data is clocked in on the rising edge of SCLK.
8	SCLK	Serial Clock Input
9	DGND	Digital Ground
10	DOUT	Serial Data Output
11	UPO	User-Programmable Output (Digital Output)
12	PD	Power-Down Input (Digital Input). Pulling PD high when PDL = V <sub>DD</sub> places the IC into shutdown with a maximum shutdown current of 20μA.
13	AGND	Analog Ground
14	REF	Buffered Reference Output/Input. In internal reference mode, the reference buffer provides a +2.5V (MAX5132) or +1.25V (MAX5133) nominal output, externally adjustable at REFADJ. In external reference mode, disable the internal reference by pulling REFADJ to V <sub>DD</sub> and applying the external reference to REF.
15	REFADJ	Analog Reference Adjust Input. Bypass with a 33nF capacitor to AGND. Connect to V <sub>DD</sub> when using an external reference.
16	V <sub>DD</sub>	Positive Power Supply. Bypass with a 0.1μF capacitor in parallel with a 4.7μF capacitor to AGND.

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

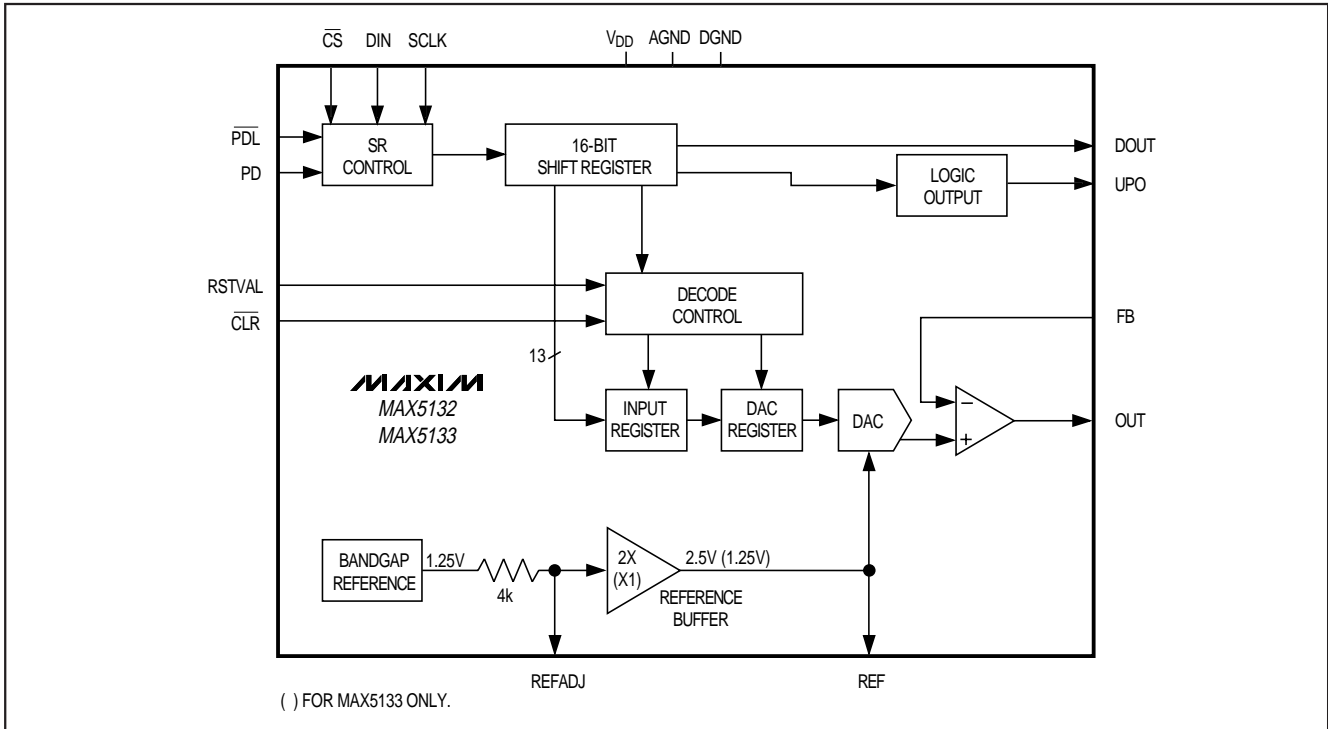

Figure 1. Simplified Functional Diagram

## Detailed Description

The MAX5132/MAX5133 13-bit, force/sense DACs are easily configured with a 3-wire serial interface. They include a 16-bit data-in/data-out shift register and have a double-buffered digital input consisting of an input register and a DAC register. In addition, these devices employ precision bandgap references, as well as an output amplifier with accessible feedback and output pins that can be used for setting the gain externally (Figure 1) or for forcing and sensing applications. These DACs are designed with an inverted R-2R ladder network (Figure 2) that produces a weighted voltage proportional to the digital input code.

## Internal Reference

Both devices use an on-board precision bandgap reference with a low temperature coefficient of only 10ppm/°C (max) to generate an output voltage of +2.5V (MAX5132) or +1.25V (MAX5133). The REF pin can source up to 100µA and may become unstable with capacitive loads exceeding 100pF. REFADJ can be used for minor adjustments to the reference voltage. The circuits in Figures 3a and 3b achieve a nominal reference adjustment range of ±1%. Connect a 33nF capacitor from REFADJ to AGND to establish low-noise

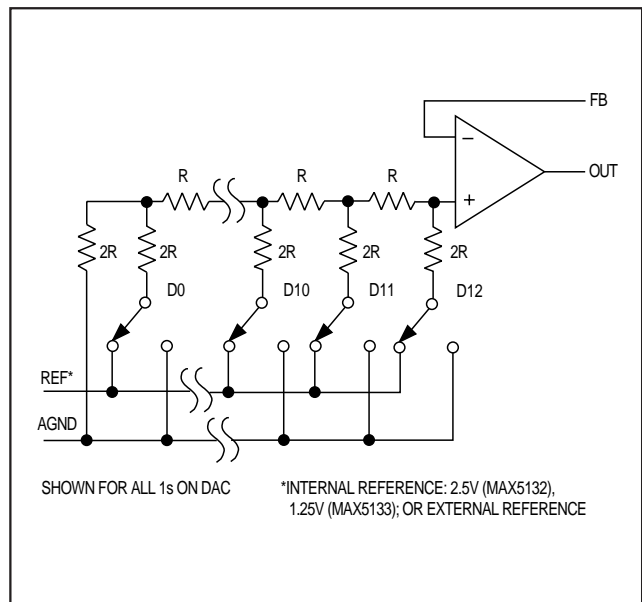

Figure 2. Simplified Inverted R-2R DAC Structure

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

operation of the DAC. Larger capacitor values may be used but will result in increased start-up delay. The time constant  $\tau$  for the start-up delay is determined by the REFADJ input impedance of  $4k\Omega$  and  $C_{REFADJ}$ :

$$\tau = 4k\Omega \cdot C_{REFADJ}$$

### External Reference

An external reference may be applied to the REF pin. Disable the internal reference by pulling REFADJ to  $V_{DD}$ . This allows an external reference signal (AC- or DC-based) to be fed into the REF pin. For proper operation, **do not** exceed the input voltage range limits of 0V to  $(V_{DD} - 1.4V)$  for  $V_{REF}$ .

Determine the output voltage using the following equation (REFADJ =  $V_{DD}$ ):

$$V_{OUT} = V_{REF}(NB / 8192)G$$

where NB is the numeric value of the MAX5132/MAX5133 input code (0 to 8191),  $V_{REF}$  is the external reference voltage, and G is the gain of the output amplifier, set by an external resistor-divider. The REF pin has a minimum input resistance of  $40k\Omega$  and is code dependent.

### Output Amplifier

The MAX5132/MAX5133's DAC output is internally buffered by a precision amplifier with a typical slew rate of  $0.6V/\mu s$ . Access to the output amplifier's inverting input (FB) provides the user greater flexibility with amplifier gain setting and signal conditioning (see *Applications Information*).

The output amplifier typically settles to  $\pm 0.5LSB$  from a full-scale transition within  $20\mu s$  when it is connected in

unity gain and loaded with  $5k\Omega \parallel 100pF$ . Loads less than  $1k\Omega$  may result in degraded performance.

### Power-Down Mode

The MAX5132/MAX5133 feature software- and hardware-programmable (PD pin) shutdown modes that reduce the typical supply current to  $3\mu A$ . To enter software shutdown mode, program the control sequence for the DAC as shown in Table 1.

In shutdown mode, the amplifier output becomes high impedance and the serial interface remains active. Data in the input registers is saved, allowing the MAX5132/MAX5133 to recall the output state prior to entering shutdown when returning to normal operation. To exit shutdown mode, load both input and DAC registers simultaneously or update the DAC register from the input register. When returning from shutdown to normal operation, wait 2ms for the reference to settle. When using an external reference, the DAC requires only  $20\mu s$  for the output to stabilize.

### Power-Down Lockout Input ( $\overline{PDL}$ )

The power-down lockout ( $\overline{PDL}$ ) pin disables shutdown when low. When in shutdown mode, a high-to-low transition on  $\overline{PDL}$  will wake up the DAC with its output still set to the state prior to power-down.  $\overline{PDL}$  can also be used to wake up the device asynchronously.

### Power-Down Input (PD)

Pulling PD high places the MAX5132/MAX5133 in shutdown. Pulling PD low will not return the MAX5132/MAX5133 to normal operation. A high-to-low transition on  $\overline{PDL}$  or appropriate commands (Table 1) via the serial interface are required to exit power-down.

X = Don't care

### Serial-Interface Configuration (SPI/QSPI/MICROWIRE/PIC16/PIC17)

The MAX5132/MAX5133 3-wire serial interface is compatible with SPI, QSPI, PIC16/PIC17 (Figure 4) and MICROWIRE (Figure 5) interface standards. The 2-byte-long serial input word contains three control bits and 13 data bits in MSB-first format (Table 2).

The MAX5132/MAX5133's digital inputs are double buffered, which allows the user to:

- load the input register without updating the DAC register,
- update the DAC register with data from the input register,
- update the input and DAC registers concurrently.

The 16-bit input word may be sent in two 1-byte packets (SPI-, MICROWIRE- and PIC16/PIC17-compatible), with CS low during this period. The control bits C2, C1, and C0 (Table 1) determine:

- the clock edge on which DOUT transitions,
- the state of the user-programmable logic output,
- the configuration of the device after shutdown.

The general timing diagram in Figure 6 illustrates how data is acquired. CS must be low for the part to receive data. With CS low, data at DIN is clocked into the register on the rising edge of SCLK. When CS transitions high, data is latched into the input and/or DAC registers, depending on the setting of the three control bits C2, C1, and C0. The maximum serial-clock frequency guaranteed for proper operation is 10MHz for the MAX5132 and 6.6MHz for the MAX5133. Figure 7 depicts a more detailed timing diagram of the serial interface.

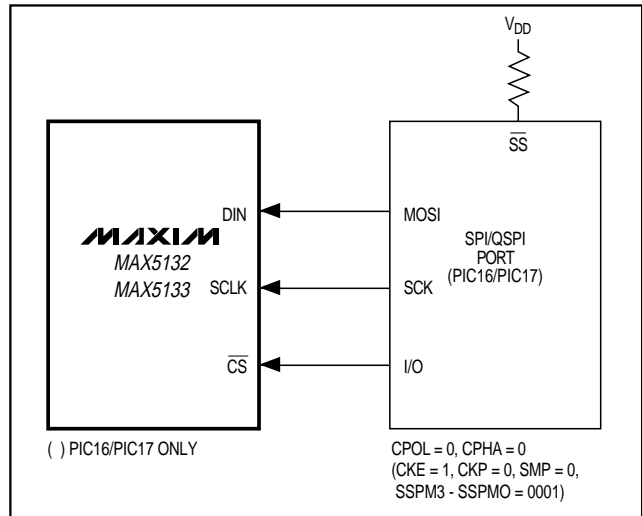

Figure 4. SPI/QSPI Interface Connections (PIC16/PIC17)

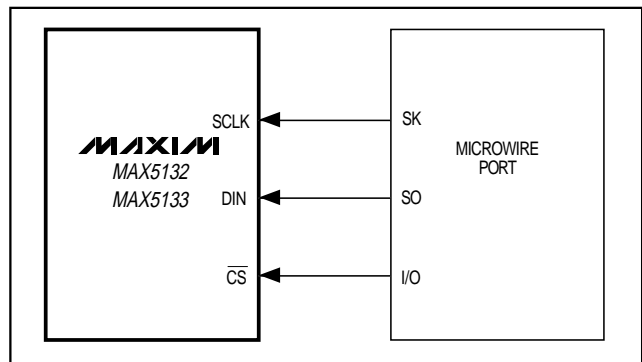

Figure 5. MICROWIRE Interface Connections

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

## PIC16 with SSP Module and PIC17 Interface

The MAX5132/MAX5133 are compatible with a PIC16/PIC17 microcontroller ( $\mu$ C), using the synchronous serial port (SSP) module. To establish SPI communication, connect the controller as shown in Figure 4 and configure the PIC16/PIC17 as system master by initializing its synchronous serial-port control register (SSPCON) and synchronous serial-port status register (SSPSTAT) to the bit patterns shown in Tables 3 and 4.

In SPI mode, the PIC16/PIC17  $\mu$ Cs allow eight bits of data to be synchronously transmitted and received simultaneously. Two consecutive 8-bit writings (Figure 6) are necessary to feed the DAC with three control bits and 13 data bits. DIN data transitions on the serial clock's falling edge and is clocked into the DAC on SCLK's rising edge. The first eight bits of DIN contain

the three control bits (C2, C1, C0) and the first five data bits (D12–D8). The second 8-bit data stream contains the remaining bits, D7–D0.

### Serial Data Output

The contents of the internal shift-register are output serially on DOUT, which allows for daisy-chaining (see *Applications Information*) of multiple devices as well as data readback. The MAX5132/MAX5133 may be programmed to shift data out of DOUT on the serial clock's rising edge (Mode 1) or on the falling edge (Mode 0). The latter is the default during power-up and provides a lag of 16 clock cycles, maintaining SPI, QSPI, MICROWIRE, and PIC16/PIC17 compatibility. In Mode 1, the output data lags DIN by 15.5 clock cycles. During power-down, DOUT retains its last digital state prior to shutdown.

### User-Programmable Output (UPO)

The UPO feature allows an external device to be controlled through the serial-interface setup (Table 1), thereby reducing the number of microcontroller I/O ports required. During power-up, this output will retain the last digital state before shutdown. With  $\overline{\text{CLR}}$  pulled low, UPO will reset to the default state after wake-up.

## Applications Information

### Definitions

#### Integral Nonlinearity (INL)

Integral nonlinearity (Figure 8a) is the deviation of the values on an actual transfer function from a straight line. This straight line can be either a best-straight-line fit (closest approximation to the actual transfer curve) or a line drawn between the endpoints of the transfer function, once offset and gain errors have been nullified. For a DAC, the deviations are measured at every single step.

#### Differential Nonlinearity (DNL)

Differential nonlinearity (Figure 8b) is the difference between an actual step height and the ideal value of 1LSB. If the magnitude of the DNL is less than or equal to 1LSB, the DAC guarantees no missing codes and is monotonic.

#### Offset Error

The offset error (Figure 8c) is the difference between the ideal and the actual offset point. For a DAC, the offset point is the step value when the digital input is zero. This error affects all codes by the same amount and can usually be compensated for by trimming.

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

### Gain Error

Gain error (Figure 8d) is the difference between the ideal and the actual full-scale output voltage on the transfer curve, after nullifying the offset error. This error alters the slope of the transfer function and corresponds to the same percentage error in each step.

### Settling Time

The settling time is the amount of time required from the start of a transition until the DAC output settles to its new output value within the converter's specified accuracy.

### Digital Feedthrough

Digital feedthrough is noise generated on the DAC's output when any digital input transitions. Proper board layout and grounding will significantly reduce this noise, but there will always be some feedthrough caused by the DAC itself.

### Unipolar Output

Figure 9 shows the MAX5132/MAX5133 setup for unipolar, Rail-to-Rail™ operation with a closed-loop gain of 2V/V. With its internal reference of +2.5V, the MAX5132 provides a convenient unipolar output range of 0 to +4.99939V, while the MAX5133 offers an output range of 0 to +2.499695V with its on-board +1.25V reference. Table 5 lists example codes for unipolar output voltages.

### Bipolar Output

The MAX5132/MAX5133 can be configured for unity-gain bipolar operation (FB = OUT) using the circuit shown in Figure 10. The output voltage  $V_{OUT}$  is then given by the following equation:

$$V_{OUT} = V_{REF} [G (NB / 8192) - 1]$$

Figure 8a. Integral Nonlinearity

Figure 8c. Offset Error

Figure 8b. Differential Nonlinearity

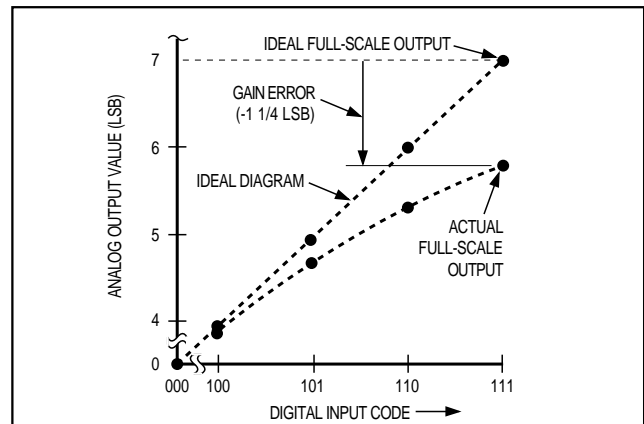

Figure 8d. Gain Error

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

# +5V/+3V, 13-Bit, Serial, Force/Sense DACs with 10ppm/°C Internal Reference

where NB is the numeric value of the DAC's binary input code,  $V_{REF}$  is the voltage of the internal (or external) precision reference, and G is the overall gain. The application circuit in Figure 10 uses a low-cost op amp (MAX4162) external to the MAX5132/MAX5133. Together with the MAX5132/MAX5133, this circuit offers an overall gain of 2V/V. Table 6 lists example codes for bipolar output voltages.

### Reset (RSTVAL) and Clear (CLR) Functions

The MAX5132/MAX5133 DACs feature a clear pin ( $\overline{CLR}$ ), which resets the output to a certain value, depending upon how RSTVAL is set.  $RSTVAL = DGND$  selects an output of 0, and  $RSTVAL = V_{DD}$  selects a midscale output when  $\overline{CLR}$  is pulled low.

The  $\overline{CLR}$  pin has a minimum input resistance of 40kΩ in series with a diode to the supply voltage ( $V_{DD}$ ). If the digital voltage is higher than the supply voltage for the part, a small input current may flow, but this current will be limited to  $(V_{\overline{CLR}} - V_{DD} - 0.5V) / 40k\Omega$ .

**Note:** Clearing the DAC will also cause the part to exit software shutdown ( $PD = 0$ ).

### Daisy-Chaining Devices

Any number of MAX5132/MAX5133s may be daisy-chained simply by connecting the serial data output pin (DOUT) of one device to the serial data input pin (DIN) of the following device in the chain (Figure 11).

Another configuration (Figure 12) allows several MAX5132/MAX5133 DACs to share one common DIN signal line. In this configuration, the data bus is common to all devices; data is not shifted through a daisy chain. However, more I/O lines are required in this configuration because each IC needs a dedicated  $\overline{CS}$  line.

## Using an External Reference with AC Components

The MAX5132/MAX5133 have multiplying capabilities within the reference input voltage range specifications. Figure 13 shows a technique for applying a sinusoidal input to REF, where the AC signal is offset before being applied to the reference input.

## Power-Supply and Bypassing Considerations

On power-up, the input and DAC registers are cleared to either zero (RSTVAL = DGND) or midscale (RSTVAL = V<sub>DD</sub>). Bypass the power supply (V<sub>DD</sub>) with a 4.7μF

capacitor in parallel with a 0.1μF capacitor to AGND. Minimize lead lengths to reduce lead inductance.

## Layout Considerations

Digital and AC signals coupling to AGND can create noise at the output. Connect AGND to the highest quality ground available. Use proper grounding techniques, such as a multilayer board with a low-inductance ground plane. Wire-wrapped boards and sockets are not recommended. If noise becomes an issue, shielding may be required.
