GENERAL DESCRIPTION

The ADG619-EP is a monolithic, CMOS single-pole doublethrow (SPDT) switch.

The ADG619-EP offers a low on resistance of 4 Ω , which is matched to within 0.7 Ω between channels. These switches also provide low power dissipation, yet result in high switching speeds. The ADG619-EP exhibits break-before-make switching action, thus preventing momentary shorting when switching channels.

The ADG619-EP is available in an 8-lead SOT-23 package.

Additional application and technical information can be found in the ADG619 data sheet.

¹ Overvoltages at IN, S, or D are clamped by internal diodes. Current should be limited to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating may be applied at a time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
