## 350MHz, 4x1 Video Crosspoint Switch with Synchronous Controls

The HA4344B is a very wide bandwidth $4 \times 1$ crosspoint switch ideal for professional video switching, HDTV, computer display routing, and other high performance applications. This circuit features very low power dissipation, excellent differential gain and phase, high off isolation, symmetric slew rates, fast switching, and latched control signals. When disabled, the output is switched to a high impedance state, making the HA4344B ideal for matrix routers.

The latched control signals allow for synchronized channel switching. When $\overline{\mathrm{CK} 1}$ is low, the master control latch loads the next switching address (A0, A1, $\overline{\mathrm{CS}}$ ), while the closed (assuming $\overline{\mathrm{CK} 2}$ is the inverse of $\overline{\mathrm{CK} 1}$ ) slave control latch maintains the crosspoint in its current state. $\overline{\mathrm{CK} 2}$ switching low closes the master latch (with previous assumption), loads the now open slave latch, and switches the crosspoint to the newly selected channel. Channel selection is asynchronous (changes with any control signal change) if both $\overline{\mathrm{CK} 1}$ and $\overline{\mathrm{CK} 2}$ are low.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100\% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## Operating Conditions

Temperature Range $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. $\theta_{J A}$ is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief 379 for details.
2. If an input signal is applied before the supplies are powered up, the input current must be limited to these maximum values.

NOTES:
3. This parameter is not tested. The limits are guaranteed based on lab characterization, and reflect lot-to-lot variation.
4. Units are $100 \%$ tested at $25^{\circ} \mathrm{C}$; guaranteed, but not tested at $0^{\circ} \mathrm{C}$ and $70^{\circ} \mathrm{C}$.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension " D " does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed $0.15 \mathrm{~mm}(0.006$ inch) per side.
4. Dimension " $E$ " does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25 mm ( 0.010 inch ) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " L " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width " $B$ ", as measured 0.36 mm ( 0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61 mm (0.024 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
