## Features

- Replaces Mechanical Relays
- High-performance, Low-cost Solution for switching between Different LAN Signals
- Ultra-low Quiescent Power ( $0.1 \mu \mathrm{~A}$ typical)
- Low Crosstalk: - $100 \mathrm{~dB} @ 10 \mathrm{MHz}$
- Low Insertion Loss or On-Resistance: 5 typical
- Single Supply Operation: $3.3 \mathrm{~V} \pm 10 \%$
- Off Isolation: -50dB @ 10 MHz
- Wide-bandwidth data rates $>200 \mathrm{MHz}$
- Packaging (Pb-free \& Green available):
- 16-pin 150 mil wide plastic QSOP (Q)
- 16-pin 173 mil wide plastic TSSOP (L)

## Description

Pericom Semiconductor's PI3L100 is a Quad 2:1 multiplexer/ demultiplexer LanSwitch with three-state outputs. This device can be used for switching between various standards, such as 10 Base-T and 100 Base-T. Generally, this part can be used to replace mechanical relays in low voltage LAN applications that have physical layer, unshielded twisted pair media (UTP) with either CAT 3 or CAT 5 grade cable.

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V},+25^{\circ} \mathrm{C}$ ambient.
3. Per TTL driven input ( $\mathrm{V}_{\mathrm{IN}}=3.0 \mathrm{~V}$, control inputs only); A and B pins do not contribute to $\mathrm{I}_{\mathrm{CC}}$.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

## Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested.
3. The bus switch contributes no propagational delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.

## Applications

## LAN Switch

The PI3L100 was designed to switch between various standards such as 10 Base-T, 100 Base-T, 100 VG-Any LAN, and Token Ring. Also general purpose applications such as loopback, line termination, and line clamps that might normally use mechanical relays are also ideal uses for this LAN Switch (see Figure 4). Generally speaking, this LAN Switch can be used for data rates to 200 Mbps and data signal levels from 0 V to 3.6 V .

| LAN Standards | Data Rate per twisted pair (UTP) |
| :--- | :--- |
| 10 Base-T | 10 Mbps |
| 100 Base-T | 100 Mbps |
| 100 VG-Any LAN | 25 Mbps |

## $\mathbf{V}_{\mathbf{C C}}$ Bias Voltage vs. $\mathbf{R O N}_{\mathbf{O N}}$

To keep $\mathrm{R}_{\mathrm{ON}}$ to a minimum, it is recommended that the $\mathrm{V}_{\mathrm{CC}}$ voltage be increased to a voltage between 3.3 V and 3.6 V . Ideally an input voltage between 0.2 V and 3.6 V will keep $\mathrm{R}_{\mathrm{ON}}$ flat.

## Signal Distortion

Distortion of the input signal is equated to 20 LOG $\Delta \mathrm{R}_{\mathrm{ON}} / \mathrm{R}_{\mathrm{L}}$. So keeping $\mathrm{R}_{\mathrm{ON}}$ flat as the data signal level varies is critical to low distortion. It should also be noted that increasing the data rate increases harmonic distortion which also effects the signal amplitude.
