

1 Introduction

The MuSLIC, a chipset of three highly sophisticated ICs, bridges the gap between the analog and the digital signal transmission in modern telecommunication systems.

This highly integrated chip set supports to realize an extremely compact Analog Subscriber Line Interface Module. Only a few external components are required and there is no trimming or adjustment necessary to meet worldwide recommendations.

Each device is made of the best fitting technology (CMOS, BiCMOS and Smart Power Technology) and the standard SMD-packages P-MQFP and P-DSO are used.

The chipset consists of the following three ICs:

- PEB 31665 (MuPP Multichannel Processor for POTS)
- PEB 3465 (QAP Quad Analog POTS)
- PEB 4165 (AHV-SLIC Advanced High Voltage Subscriber Line Circuit)

Version 1.0

CMOS

1.1 Features

- Chip set of three well fitted chips optimized for a 16 POTS-base system
- Including all low and high voltage SLIC functions
- Only a few external components are required
- No trimming or adjustments are required
- Specification according to relevant ITU-T, LSSGR and DTAG recommendations
- Digital signal processing technique
- Advanced low power CMOS and BiCMOS¹⁾ and Smart Power technology
- PCM encoded digital voice transmission (A-Law or μ -Law)
- Two serial IOM-2 (GCI) Interfaces with together 6 pins
- 12 Pin, 8 bits parallel microcontroller interface
- High performance AD and DA Conversion
- Programmable digital filters for
 - Impedance matching
 - Transhybrid balancing
 - Frequency response
 - Gain
- Advanced test capabilities
 - Integrated line and circuit tests
 - Two programmable tone generators

¹⁾ Abbreviations see chapter 10.3

Type	Ordering Code	Package
PEB 3465 V1.0	on request	P-MQFP-80-1
PEB 31665 V1.0	on request	P-MQFP-44-2
PEB 4165 V1.0	on request	P-DSO-20

Introduction

- Fully digital programmable DC-Characteristic
 - Programmable Constant Current from 0 to 50 mA
 - Programmable Resistive Values from 0 to $2 \times 500 \Omega$
 - Programmable Constant Voltage
- Programmable Integrated Teletax Injection and Filtering during Active in Onhook and Offhook
 - Programmable up to 10 Vrms at Ring/Tip-wire of the AHV-SLIC
 - Programmable frequency (12/16 kHz)
- Polarity reversal (programmable soft or hard)
- Integrated (balanced) Ringing Generation with zero crossing injection
 - Programmable frequency between 16.6 and 70 Hz
 - Programmable amplitude up to 85 Vrms at Ring/Tip-wire of the AHV-SLIC
- Three operating modes: Power Down, Active and Ringing
- Offhook detection with programmable thresholds for all operating modes
- Integrated Ring Trip Detection with zero crossing turn off function
- Ground Start and Loop Start possible
- Integrated checksum calculation for CRAM (AC and DC separated)
- Linecard Identification
- Sensing of transversal and longitudinal line current
- Battery voltage – 24 V ... – 80 V; Auxiliary voltage + 5 V... + 85 V
- Boosted battery mode with up to 150 V supply for long telephone lines and up to 85 Vrms balanced ringing
- Reliable 170 V Smart Power Technology
- Standard SMD packages: P-MQFP-44 and P-MQFP-80 for the low voltage parts and small power package P-DSO-20 for the high voltage device

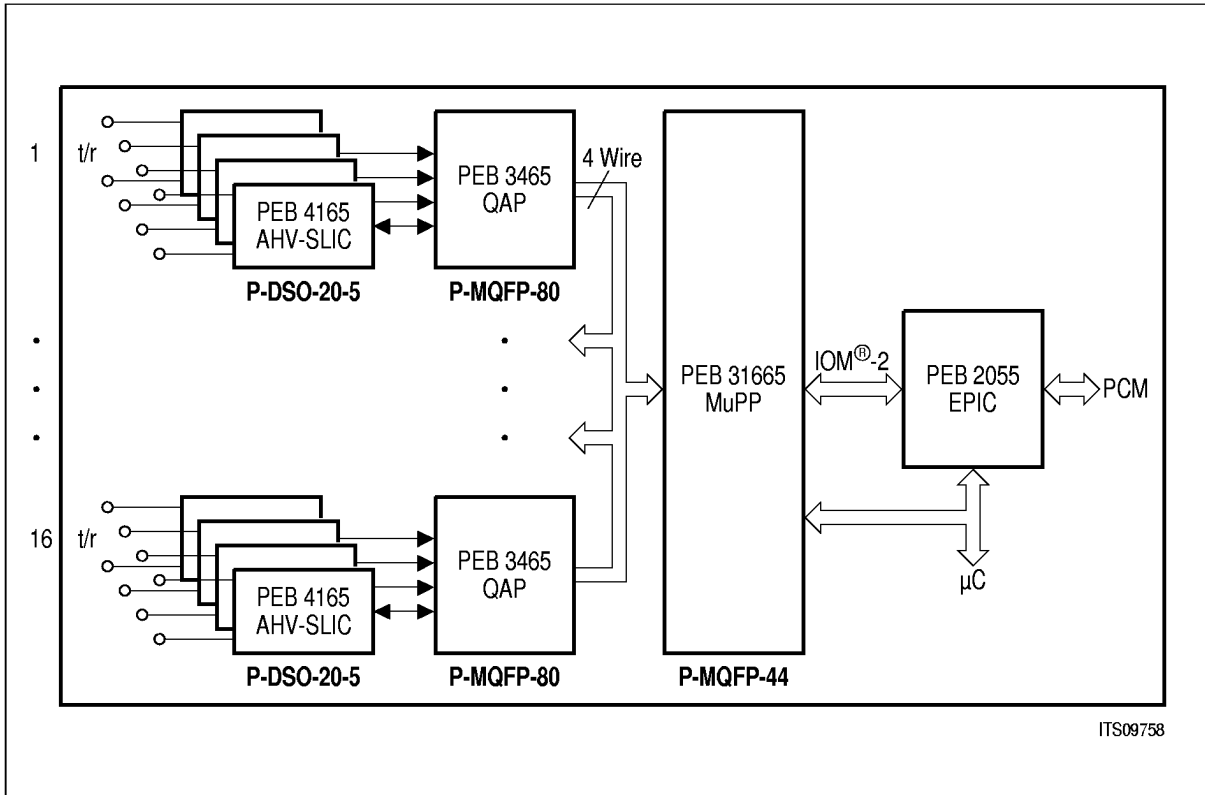

Figure 11 Application Example of a Central Office Analog Linecard for 16 Subscribers

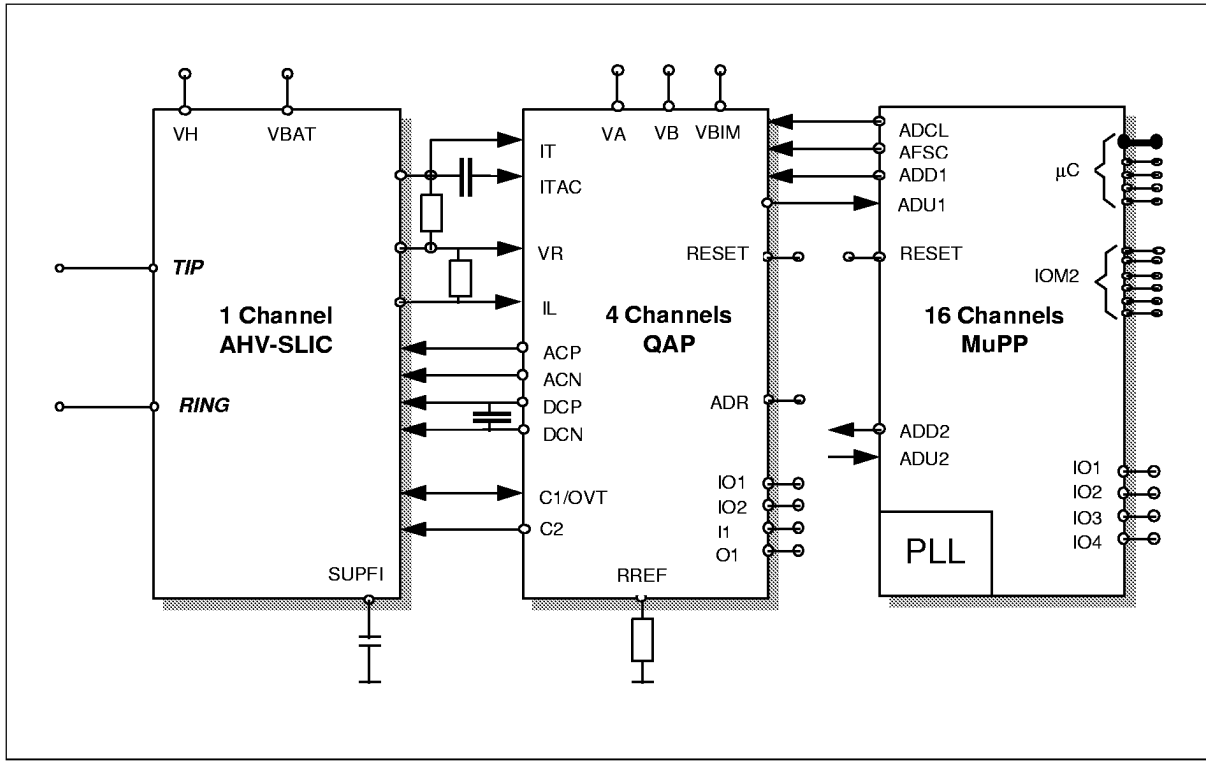

Figure 12 Overview of the Connection of MuPP, QAP and AHV-SLIC for One Subscriber

Functional Description**2 Functional Description**

The Multichannel Signal Processing Subscriber Line Interface Codec Filter Chipset, MuSLIC, is a logic continuation of the well established family of the SIEMENS PCM-Codec-Filter-ICs with the integration of all DC-feeding, Supervision and Meterpulse Injection features on chip as well. Fabricated in advanced CMOS, BiCMOS and High Voltage Technology SPT170 the MuSLIC is tailored for very flexible solutions in analog/digital communication systems.

The chip set consists of the digital signal processor for 16 channels (MuPP, multichannel processor for POTS), the analog/digital and digital/analog converter for 4 channels (QAP, quad analog POTS) and the high voltage interface chip for 1 channel (AHV-SLIC, advanced high voltage subscriber line interface circuit).

The MuPP uses the benefits of a DSP not only for the voice channel but even for line feeding and supervision which leads to a very high flexibility without the need of external components. Based on an advanced digital filter concept, the PEB 31665 (MuPP) and the PEB 3465 (QAP) provides excellent transmission performance. The new filter concept leads to a maximum of independence between the different filter blocks. Each filter block can be seen as a one to one representative of the corresponding network element. Together with the software package MuSLICOS, filter optimizing to different applications can be done in a clear and straight forward procedure. The AC frequency behavior is mainly determined by the digital filters. Using the oversampling 1 bit $\Sigma\Delta$ -AD/DA converters, linearity is only limited by second order parasitic effects.

The digital solution of line feeding offers free programmability of feeding current and voltage as well as very fast settling of the dc-operating point after transitions. A 0.3 Hz lowpass filter in the DC-loop is mainly responsible for the system stability.

Additionally teletax generation and filtering is implemented as well as free programmable balanced ring generation with zero-crossing injection. Offhook detection with programmable thresholds is possible in all operating modes. To reduce overall power consumption of the linecard, the MuPP, the QAP and the AHV-SLIC provide a Power Down mode.

To program the MuSLIC or to get status information about the chipset or the system 2 user interfaces are available: the IOM-2 interface and a 8-bit-parallel simple microcontroller interface.

The PEB 4165 (AHV-SLIC) provides battery feeding between – 24 V and – 80 V and ringing injection with a differential ring voltage up to 85 Vrms. In order to achieve these high amplitudes, an auxiliary positive battery voltage is used during ringing. This voltage can also be applied to drive very long telephone lines.

The AHV-SLIC is designed for a voltage feeding - current sensing line interface concept and provides sensing of transversal and longitudinal currents on both wires. In Power Down mode the AHV-SLIC is switched off turning the line outputs to a high impedance state. Off-hook supervision is provided by activating a simple line current sensor.

Functional Description

2.1 Principles

2.1.1 Signal Flow Graph: AC

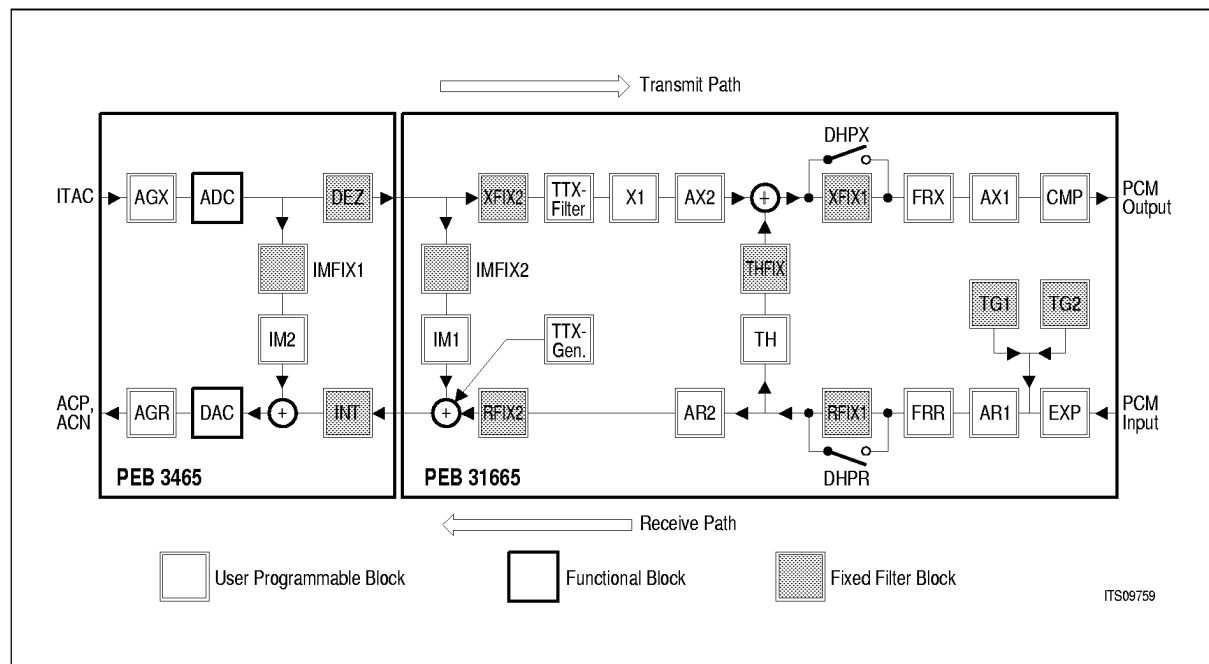

Figure 13

Transmit Path

The analog input signal has to be connected to pin ITAC of the PEB 3465 by an external capacitor (470 nF) for AC/DC separation. After passing a programmable gain stage (AGX = 0 or 6 dB) and a simple antialiasing prefilter the voice signal is converted to a 1-bit digital data stream in the $\Sigma\Delta$ -converter. The first down sampling steps are done in fast running digital hardware filters on the PEB 3465. This down sampled AC-signal (64 kHz sampling rate) is sent to the PEB 31665 via the MuPP/QAP-Interface in the ADU-channel. The following signal processing is done in the DSP-machine of the PEB 31665. The benefits of this are the programmability of frequency and gain behavior. At the end the fully processed signal is transferred to the IOM-2 Interface in a PCM-compressed (A-law / μ -law) signal representation.

Functional Description

Receive Path

The digital input signal is received via the IOM-2 Interface of the PEB 31665. Expansion, PCM-lowpass-filtering, gain correction and frequency response correction are the next steps which are done by the DSP-machine. This 64 kHz AC signal is sent from the QAP to the MuPP via the MuPP/QAP-Interface in the ADD-channel. The up sampling interpolation steps are processed by fast hardware structures in the PEB 3465 to reduce the DSP-workload. The 1-bit data stream is then converted to an analog equivalent. A subsequent programmable gain stage (AGR = 0 or 6 dB) and smoothing filter provides the AC output signal at the Pins ACP and ACN of the PEB 3465 for direct connection to the AHV-SLIC PEB 4165.

Loops

There are two different loops implemented: The Impedance Matching (IM) loop which is divided into 2 separate loops to guarantee very high flexibility to various impedances, and the Transhybrid Balancing (TH) loop.

For test purposes it is possible to close a loop behind the $\Sigma\Delta$ -converter to check either the analog of the digital part of the PEB 3465 and the PEB 31665 respectively.

2.1.2 Signal Flow Graph: DC

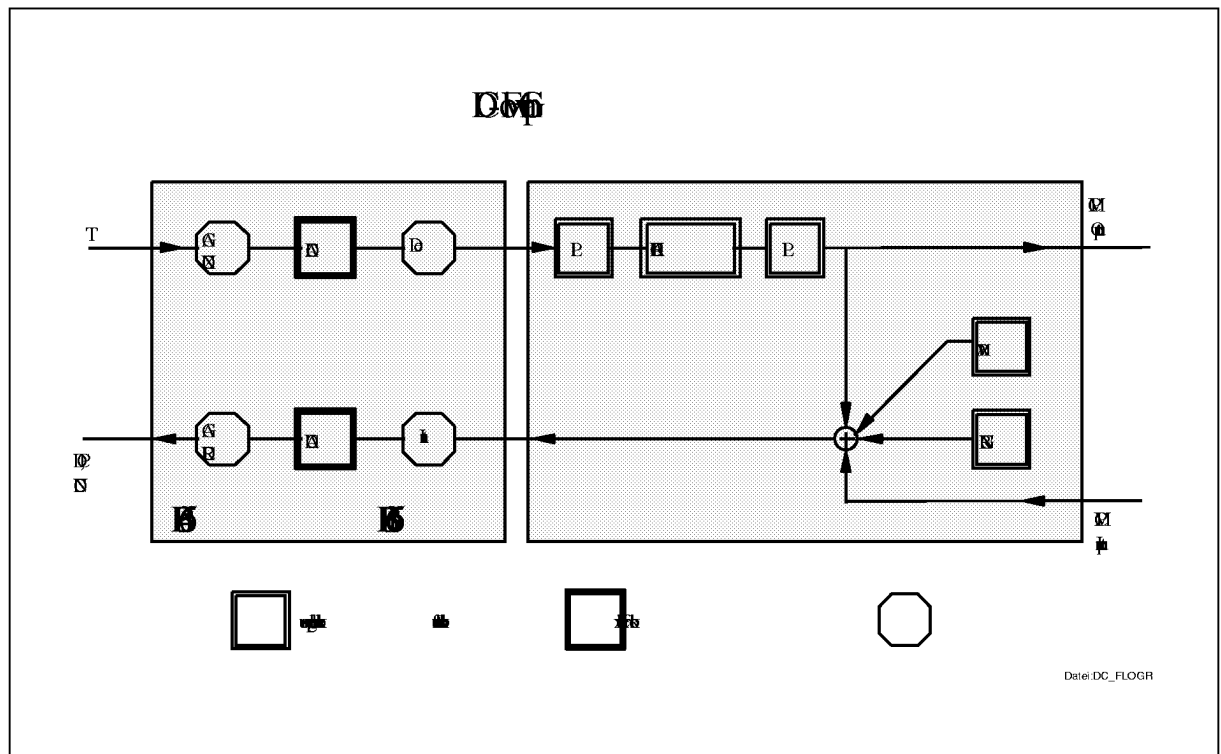

Figure 14

Functional Description

DC Characteristic

The incoming information (transmit direction) at pin IT (scaled transversal AC + DC-current, transferred to a voltage via an external 1.5 k Ω resistor at IT) passes first an antialiasing filter and is then converted to a 1-bit digital data stream in the $\Sigma\Delta$ -converter. Down sampling is done in hardware filters of the PEB 3465. This DC-information (2 kHz sampling rate) is then fed to the PEB 31665 where it is first lowpass filtered (0.3 Hz corner frequency) for stability and noise reasons. The following DC-characteristic consists of three branches which represents different kinds of feeding behavior. In typical applications it acts as a programmable constant current source ($R_{in} > 30$ k Ω). If the desired value cannot be held feeding switches automatically and smoothly to the resistive branch (R_{in} programmable between 0 ... 1 k Ω). The third branch is used for feeding long lines - the DC-characteristic switches to a constant voltage behavior. For superimposing voice as well as Teletax pulses the necessary drop at the line can be calculated and taken into account as well. The outgoing bit stream (2 kHz sampling rate), representing the DC-feeding value is then sent back to the PEB 3465 where a 1-bit $\Sigma\Delta$ -converter and a following smoothing filter (using an external 33 nF capacitor) establish the desired values at the Pins DCP and DCN, respectively. Depending on the operating mode (Active, Ringing, Active with Boosted Battery) a gain of 0 or 4 dB is inserted.

For test purposes it is possible to close a loop to test either the analog part or the digital part of the DC path.

Supervision

The HOOK-information is the most important one and is provided via the IOM-2 Interface (CIDU-4: HOOK; see **chapter 4.2**), in all operating modes:

- **Power Down:** In this state the transversal line current is sensed by the PEB 4165 and fed to the PEB 3465 via Pin IT. Offhook is detected if the voltage at IT exceeds a programmed value.
- **Active:** Offhook is detected if the incoming voltage at IT exceeds a programmed value. To avoid instable information, lowpass filtering and a hysteresis is provided.
- **Ringing:** Offhook is detected if the DC-value at IT exceeds the programmed Ring Trip threshold. The AC-value is filtered automatically. Ring Trip detection is reported within 2 cycles of the ring period and then the internal ring generator is switched off within 2 cycles at zero crossing of the ring voltage.

For Ground Key information the PEB 4165 provides the longitudinal current information at the Pin IL. The PEB 3465 uses a $\Sigma\Delta$ -converter - similar to the DC-transmit path - to convert this signal to its digital representation. The accuracy is $\pm 10\%$ compared to $\pm 5\%$ of the DC-path. The 1-bit digital data stream is also down sampled and sent to the

Functional Description

PEB 31665 via the ADU-channel of the MuPP/QAP-Interface. Generation of the Ground Key bit is done in the PEB 31665 (CIDU-3: GNK; see **chapter 4.2**)

Additional Features

The PEB 3465 provides three general purpose input Pins (VA, VB, VBIM) for measuring. Via the MuPP/QAP-Interface it is possible to select one of these inputs for the measurement. The DC-signal at the selected input is converted to digital using the same $\Sigma\Delta$ -converter as for Ground Key information (accuracy of $\pm 10\%$) and sent to the PEB 31665. The input range is between $-2.4\text{ V} \dots +2.4\text{ V}$. As a further selection it is also possible to measure the internal VDDZ-voltage of the PEB 3465.

2.1.3 AHV-SLIC

The Advanced High Voltage Subscriber Line IC (AHV-SLIC) PEB 4165 is a reliable interface between the telephone line and the PEB 3465/PEB 31665.

The PEB 4165 supports AC and DC control loops based on feeding a voltage V_{RT} to the line and sensing the transversal line current I_{RT} (**figure 15**).

DC- and AC-voltages are handled separately with different gain on the AHV-SLIC. Both are applied differentially via pins DCP, DCN, and ACP, ACN, respectively. The line voltages V_R and V_T are the amplified input voltages, related to the mean supply voltage, $V_T = VTIP = (VH' - VBAT) / 2 - 25 \times VDCN - 50/16 \times VACN$

$$V_R = VRING = (VH' - VBAT) / 2 - 25 \times VDACP - 50/16 \times VACP.$$

Depending on the operation mode, VH' is switched either to VH or to BGND via the supply switch. The transversal line voltage $V_{RT} = V_R - V_T$ is simply related to the input voltages

$$V_{RT} = 25 \times (VDACP - VDCN) + 50/16 \times (VACP - VACN) = 50 \times VDACP + 6.25 \times VACP$$

A reversed polarity of V_{RT} is easily obtained by changing the sign of $(VDACP - VDCN)$.

The transversal and longitudinal currents are measured in the buffers and scaled images are provided at the IT and IL pin, respectively:

$$IT = (I_R + I_{TIP})/100 = I_{RT}/50 \qquad IL = -(I_R - I_{TIP})/100 = -I_{Long}/50$$

Functional Description

Figure 15 Definition of Output Current Directions

The PEB 4165 operates in four modes controlled by ternary logic signals at the C1 and C2 input (see table 3).

Table 3 Programming of Operating Modes

		C 2 (Pin 9)		
		VIL	VIM	VIH
C 1 (Pin 8)	VIL	PDNH	PDNR	HIR
	VIM	PDNH	BB	HIT
	VIH	PDNH	ACT	HIRT

HIR ... Ring wire set to high impedance

HIT ... Tip wire set to high impedance

High Impedance (HIR/HIT/HIRT): In this mode each of the line outputs can be programmed to show high impedance. HIT switches off the TIP buffer, while the current through the RING output still can be measured by IT or IL. Programming HIR switches off the RING buffer. In the mode HIRT both buffers show high impedance.

Active (ACT): This is the regular transmit and receive mode for voiceband and teletax. The line driving section is operated between VBAT and BGND.

Boosted battery (BB): In order to provide a balanced ring signal of up to 85 Vrms or to drive longer telephone lines, an auxiliary positive battery voltage VH is used, enabling a higher voltage across the line. Transmission performance remains unchanged compared with ACT mode.

Functional Description

The Power Down (PDN) state is intended to reduce power consumption of the linecard to a minimum: the PEB 4165 is switched off completely, no operation is available.

With respect to the output impedance of TIP and RING two PDN-modes have to be distinguished:

A resistive one (PDNR) provides a connection of 10 kΩ each from TIP to BGND and RING to VBAT, respectively, while the outputs of the buffers show high impedance (figure 16). The current through these resistors is sensed and transferred to the IT pin to allow offhook supervision.

The other mode (PDNH) offers high impedance at TIP and RING.

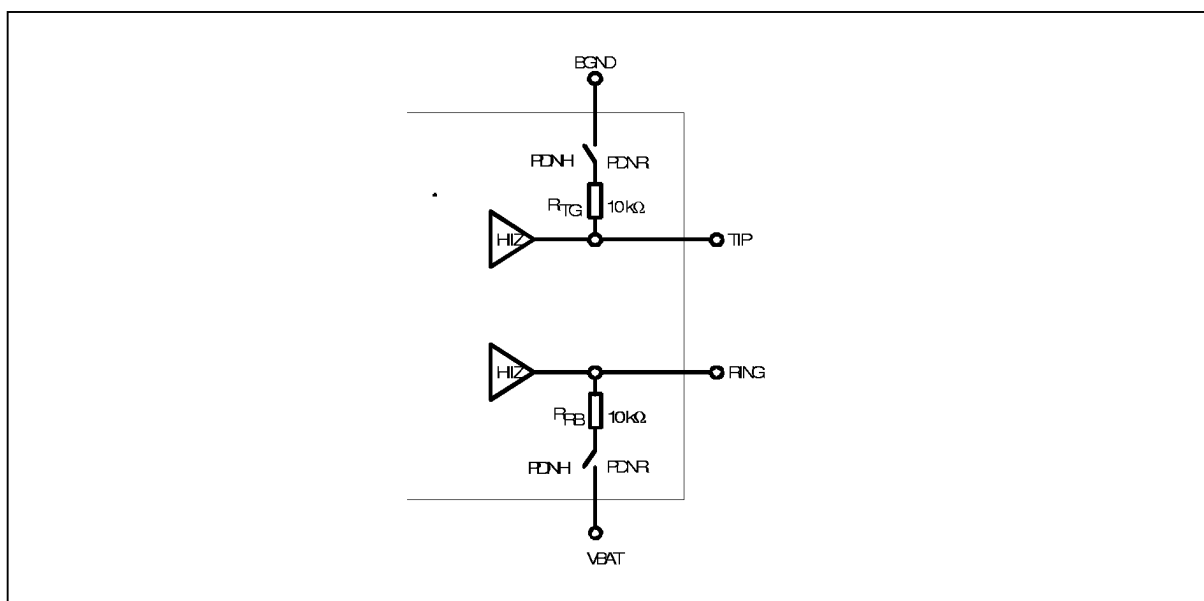

Figure 16 TIP and RING Impedance in Power Down

2.1.4 Test Features

There are two different kinds of test features: Internal test loops for circuit testing and defined test loops to perform board and line tests. There are loops for testing AC and DC path. As a special feature it is possible to switch signals to and from the DC-path via the IOM-2 Interface. Additionally there is the possibility to cut off the AC-receive and transmit path (the different kinds of testmodes are described in chapter 8).

3 Interfaces

3.1 IOM[®]-2 Interface

The IOM-2 Interface consists of two data lines and two clock lines. DU (data upstream) carries data from the MuSLIC to a master device. DD (data downstream) carries data from the master device to the MuSLIC. A frame synchronization clock signal (8 kHz, FSC) as well as a data clock signal (4096 kHz, DCL) has to be supplied to the MuSLIC. The MuSLIC handles data as described in the IOM-2 specification for analog devices (see **chapter 10.1**).

Figure 17 IOM[®]-2 Interface Timing for 8 Voice Channels (per 8 kHz frame)

Figure 18 IOM[®]-2 Interface Timing (DCL = 4096 kHz, per 8 kHz frame)

IOM[®]-2 Time Slot Assignment

An assignment of 16 time slots is given by the two IOM-2 interfaces of the MuPP. Each of them assigns 8 time slots synchronized with the FSC. This 8 slot structure is carried on from the MuPP to the QAP. In the QAP the assignment is partly done by pin-strapping (see figure 19).

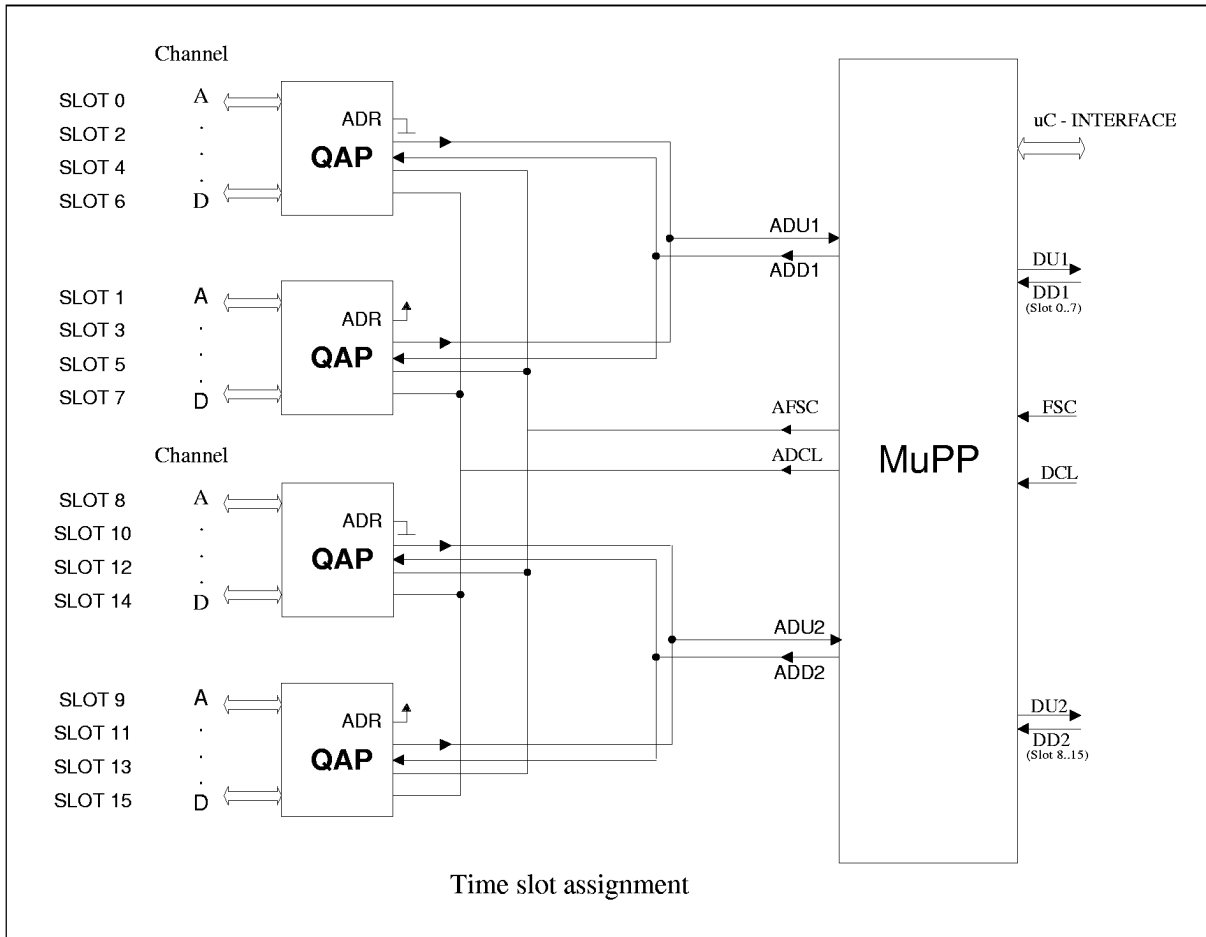

Figure 19 Time Slot Assignment

3.2 μ C Interface

The parallel μ C-Interface is used to communicate with an external master device and consists of four control lines (ALE, CSQ, RDQ, WRQ) and 8 bidirectional data lines (DIO0 ... DIO7) and provides fast parallel data transfer to a microcontroller device as an alternative to the IOM-2 monitor channel data transfer. Only one method of transfer can be used at a time, with the μ C-Interface having a higher priority than the IOM-2 Interface. Thus, data transfer via the μ C-Interface interrupts a communication via the IOM-2 monitor channel. During a data transfer cycle via the μ C-Interface, IOM-2 monitor channel data will be ignored. The C/I-channel information is still transferred via the C/I-channel of the IOM-2 interface and is not affected by the μ C-Interface communication.

The μ C-Interface of the MuPP has a multiplexed 8-bit address/data bus and allows direct connection to a microcontroller of the 8051- and the Siemens C16X-family without additional components.

With every falling edge of ALE-line the MuPP latches the bus data on the 8 data lines DIO0 ... DIO7 and stores it as address information. CSQ combined with RDQ or WRQ starts the data transfer cycle via the parallel μ C-Interface. The data on DIO0 ... DIO7 are valid on the rising edge of WRQ/RDQ (if CSQ is low). Depending on the previously latched address information, these data have a different meaning; e.g. the 8 bit of a command/data byte is preceded by the address 00000001 or the subscriber/slot address for a subsequent data byte of a e.g. SOP-, TOP-, or COPI-command has the address information 00000000 (see **table 4**).

A data transfer cycle to address 00000000 and 11111111 is already finished after the transfer of the first data byte; transfer cycles to addresses 00000001 and 00000010 consists of more transfers, depending on the length information in the first byte.

As soon as the data transfer cycle via the μ C-Interface has been completed, control information via the IOM-2 monitor channel will be accepted again (synchronized with the next FSC), until the next data transfer cycle starts with CSQ and RDQ/WRQ.

Figure 20 Example for a Read Access, with One Data Byte Transferred via DIO

Figure 21 Example for a Write Access, With One Data Byte Transferred

Table 4 Possible Address Information to Identify the Following Data Nibbles

Address	Command
00000000	address
00000001	data
00000010	status
...	reserved
11111111	reset μ C Interface

Data transfer to and from the MuSLIC is asynchron and the data will be transferred in bytes. Basically there is no difference to the IOM-2 commands, accept those which requires a slot specific address information.

3.3 MuPP/QAP Interface

The MuPP/QAP-Interface, the link between the MuPP and the QAP, is a serial interface based on the 6 signals AFSC (analog frame sync), ADCL (analog data clock), ADU1/ADU2 (analog data upstream) and ADD1/ADD2 (analog data downstream). ADU1 and ADD1 are common to the first group of 8 time slots (channels) and ADU2 and ADD2 to the second 8 time slots (channels). AFSC and ADCL are common to both groups of time slots (timing diagram see **chapter 7.2.6**).

Figure 22 MuPP/QAP Interface: Frame, Bit Structure

3.4 QAP/AHV-SLIC Interface

Output Voltage AC (ACP, ACN)

The output voltage at the pins ACP and ACN represents the AC-information together with Teletax info at the receive path. The AC-information is received via the MuPP/QAP-Interface in the ADD channel. The 64-kHz Bitstream is converted to analog, passes a programmable gain stage of 0 / – 6 dB and is buffered to drive a load of $R_L > 15 \text{ k}\Omega$ and $C_L < 10 \text{ pF}$, which is the input impedance of the AHV-SLIC.

Output Voltage DC (DCP, DCN)

The output voltage at the pins DCP and DCN represents the DC-information together with the Ring Burst at the receive path. The DC-information is received via the MuPP/QAP-Interface in the ADD channel. The 2-kHz Bitstream is converted to analog and buffered to drive an external smoothing capacitor of 33 nF. The pins are directly connected to the AHV-SLIC.

Transversal Current Sense AC - Input (ITAC)

The pin ITAC is the input voltage pin for the AC transversal current information from the AHV-SLIC in the transmit path. AC/DC separation is done by an external highpass filter (ext. capacitor = 470 nF). The input resistance is larger than 20 k Ω . Current/voltage conversion is done via an external resistor of 1.5 k Ω (same for pin IT). The signal passes a programmable gain stage 0 or 6 dB, is converted to digital and sent to the PEB 31665 via the MuPP/QAP-Interface in the ADU channel (64-kHz Bitstream).

Transversal Current Sense DC - Input (IT)

The pin IT is the input voltage pin for the DC transversal current information from the AHV-SLIC in the transmit path. The input resistance is larger than 500 k Ω . Current/voltage conversion is done via an external resistor of 1.5 k Ω (same for pin ITAC). The voltage at Pin IT is lowpass filtered and converted to digital. The bitstream (2 kHz) is sent to the PEB 31665 via the MuPP/QAP-Interface for further signal processing.

Longitudinal Current Sense - Input (IL)

The scaled longitudinal current information transferred from the AHV-SLIC - the current/voltage conversion is done by an external resistor of 1.5 k Ω - is converted into digital and sent to the PEB 31665 via the MuPP/QAP-Interface in the ADU channel. In the PEB 31665 the IL-information is lowpass filtered (time programmable using DUPGNK-counter) and reported via the Data Upstream C/I-channel (CIDU-3) of the IOM-2 interface if the measured value exceeds a programmed limit. In Power Down, the GNK-bit is set to "0" and the setting of the Interrupt bit (CIDU-3) caused by GNK is prohibited.

Ternary Interface (C1, C2)

In order to set the AHV-SLIC to the different operating modes, the information of the board-controller is passed through from the IOM-2-channel via the MuPP/ QAP-Interface to the ternary AHV-SLIC-Interface pins C1 and C2.

Table 5

		C2		
		VOL	VOM	VOH
C1	VOL	PDNH	PDNR	HIR
	VOM	ACT2	BB	HIT
	VOH	ACT3	ACT	HIRT

- PNDH - Power Down High Impedance
- PDNR - Power Down Resistive
- ACT - Active Mode
- ACT2 - Active Mode 2 (power save for SLIC, for future use)
- ACT3 - Active Mode 3 (power save for SLIC, for future use)
- BB - Boosted Battery
- HIR - Ring wire set to high impedance
- HIT - Tip wire set to high impedance
- HIRT - Ring and Tip wires set to high impedance

For signalling “Over temperature” the AHV-SLIC drains a current (IOT) from pin C1. This current is sensed by the PEB 3465 and transferred in the ADU channel to the PEB 31665. The PEB 31665 sends the overtemperature message via the C/I-channel (CIDU-2: SLCX and TCR0-5) of the IOM-2 Interface. This is possible in any operating states of the AHV-Interface except for Power Down.

Programming the MuSLIC

4 Programming the MuSLIC

With the appropriate commands, the MuSLIC can be programmed and verified very flexible via the IOM-2 Interface Monitor channel, and the Microcontroller Interface respectively.

Transfer via the IOM[®]-2 Interface

Data transfer to the MuSLIC starts with a MuSLIC-specific address byte (81_H).

With the second byte one of 5 different types of commands (SOP, TOP, XOP, COP or COPI) is selected. Due to the extended MuSLIC feature control facilities these commands contain additional information (e.g. number of subsequent bytes) for programming (write) and verifying (read) the MuSLIC status.

A write command is followed by up to 8 bytes of data. The MuSLIC responds to a read command with its IOM-2 specific address and the requested information, that is up to 15 bytes of data.

Attention: Each byte of the monitor channel has to be transferred twice at least according to the IOM-2 Monitor handshake procedure. (For more information on IOM-2 specific Monitor Channel Data Structure see **chapter 3.1** and **chapter 10**).

Transfer via the Microcontroller Interface

Data transfer to and from the MuSLIC is asynchron and the data will be transferred in bytes. Basically there is no difference to the IOM-2 commands.

(For more information, about the μ C Interface see **chapter 3.2**).

4.1 Types of Monitor / μ C Interface Bytes

The 8-bit Monitor / μ C Interface bytes have to be interpreted as either commands or status information stored in Configuration Registers or the Coefficient RAMs. There are 5 different types of MuSLIC commands which are selected by bit 4 and 5 (partly bit 2 and 3) as shown below.

SOP	STATUS OPERATION:				MuSLIC status setting/monitoring			
Bit	7	6	5	4	3	2	1	0
	B	RW	0	1	ATR	LSEL2	LSEL1	LSEL0

XOP	EXTENDED OPERATION:				General settings			
Bit	7	6	5	4	3	2	1	0
	0	RW	1	0	ATR	LSEL2	LSEL1	LSEL0

Programming the MuSLIC

TOP TRANSFER OPERATION: Read Certain Status / Options only

Bit	7	6	5	4	3	2	1	0
	0	R	1	1	0	0	LSEL1	LSEL0

COP COEFFICIENT OPERATION: Filter coefficient setting/monitoring

Bit	7	6	5	4	3	2	1	0
	ICRAM	RW	0	0	0	1	WCRAM1	WCRAM0

COPI COEFFICIENT OPERATION INITIALIZE: Coefficient set assignment

Bit	7	6	5	4	3	2	1	0
	B	RW	0	0	1	0	LSEL1	LSEL0

Table 6 Storage of Programming Information

6 status configuration registers: (for each channel)	SCR0, ... SCR5 accessed by SOP command
2 test registers: (for each channel)	STCR0, STCR1 accessed by SOP command
9 extended configuration registers:	XR0 ... XR8 accessed by XOP command
18 extended test registers:	XTR0 ... XTR17 accessed by XOP command
2 Transfer configuration registers: (for each channel)	TCR0, TCR1 accessed by TOP command
AC- and DC-Coefficient RAMs:	CRAMs accessed by COP command
2 coefficient set assignment registers: (for each channel)	CAR0, CAR1 accessed by COPI command

Programming the MuSLIC

Overview of commands and registers via the IOM-2/ μ C Interface:

SOP Command

Bit	7	6	5	4	3	2	1	0
SOP for SCR/STCR	B	RW	0	1	ATR	LSEL2	LSEL1	LSEL0

CAR0	DC1	DC0	AC2	AC1	AC0	0	0	HLOAD

CAR1	TG1.2	TG1.1	TG1.0	TG2.2	TG2.1	TG2.0	0	0
------	-------	-------	-------	-------	-------	-------	---	---

Programming the MuSLIC

4.1.1 SOP Command

To modify or evaluate the MuSLIC status, individually for each channel, the contents of up to 6 configuration registers SCR0, ... SCR5 may be transferred to or from the MuSLIC. This is done by a SOP Command (status operation command).

With ATR = 1 and LSEL0 = 0/1 and LSEL1 = LSEL2 = 0 the registers STCR0, STCR1 can be set/read.

Bit	7	6	5	4	3	2	1	0
	B	RW	0	1	ATR	LSEL2	LSEL1	LSEL0

B Broadcast

B = 0 Only one channel (time slot) is programmed

B = 1 All channels (up to 16) are programmed with the same information

RW Read/Write Information: Enables reading from the MuSLIC or writing information to the MuSLIC

RW = 0 Write to the MuSLIC

RW = 1 Read from the MuSLIC

ATR Access Test Register

ATR = 0 SCR0 ... SCR5 Registers are available

ATR = 1 STCR0, STCR1 Registers are read/writeable

LSEL Length select information

This field identifies the number of SOP Register

ATR	LSEL 2	LSEL 1	LSEL 0	
0	0	0	0	SCR0
0	0	0	1	SCR1
0	0	1	0	SCR2
0	0	1	1	SCR3
0	1	0	0	SCR4
0	1	0	1	SCR5
0	1	1	1	SCR0 to SCR5
1	0	0	0	STCR0
1	0	0	1	STCR1

Programming the MuSLIC

SCR0 Configuration Register 0

Configuration register SCR0 defines the basic feeding modes of the MuSLIC and enables/disables test features:

Bit 7	6	5	4	3	2	1	0
POLNR	N/BB	LB	ETG2	ETG1	ENO	ENTE	COR

Reset value: 00_H

- POLNR** Normal or Reverse Polarity (see **chapter 5.4**)
 POLNR = 0 sets the MuSLIC to Normal Polarity feeding
 POLNR = 1 sets the MuSLIC to Reverse Polarity feeding

- N/BB** MuSLIC is in normal or Boosted Battery mode (see **chapter 5.4**).
 N/BB = 0 Normal feeding
 N/BB = 1 Changes ternary interface to AHV-SLIC which sets the AHV-SLIC to Boosted Battery mode

- LB** Handling of Loop Back functions for testing PCM loops
 LB = 0 normal function
 LB = 1 the desired Loop Back function is enabled

- ETG2** Enables programmable Test Tone Generator 2
 ETG2 = 0 Test Tone Generator 2 is disabled
 ETG2 = 1 Test Tone Generator 2 is enabled

- ETG1** Enables programmable Test Tone Generator 1
 ETG1 = 0 Test Tone Generator 1 is disabled
 ETG1 = 1 Test Tone Generator 1 is enabled

- ENO** Enables Offset compensation
 ENO = 0 no DC offset compensation
 ENO = 1 DC offset compensation

- ENTE** Enables Test
 ENTE = 0 normal operation
 ENTE = 1 enables the test selected by the test registers (see **chapter 8**)

- COR** Cut Off Receive Path for test reasons (see **chapter 8**)
 COR = 0 Receive Path transmission is available
 COR = 1 Receive Path is disabled

Programming the MuSLIC

SCR1 Configuration Register 1

Configuration register SCR1 defines the meterpulse settings and the soft/hard reversal, linear mode and IO settings.

Bit 7	6	5	4	3	2	1	0
TTXNO	TTX12	NOSL	SOREV	ACT3	ACT2	QIO2D	QIO1D

Reset value: 00_H

TTXNO Meterpulses are represented by teletax (TTX) with 12 or 16 kHz or with Reverse Polarity

TTXNO = 0 Meterpulses are represented with 12 kHz or 16 kHz

TTXNO = 1 Meterpulses are represented with Reverse Polarity

TTX12 Teletax-signal with 12 kHz or 16 kHz

TTX12 = 0 16 kHz teletax-signal

TTX12 = 1 12 kHz teletax-signal

NOSL No slope: means that the ramping of teletax (TTX) signal is switched off

NOSL = 0 Slope of TTX-Signal is smooth

NOSL = 1 Hard switch of TTX-Signal

SOREV Soft Reversal Meterpulses

SOREV = 0 hard reversal

SOREV = 1 soft reversal

ACT3 Active Mode with power save status of HV-SLIC (for future use)

ACT3 = 0 normal mode

ACT3 = 1 C1, C2 indicates the power save mode for the HV-SLIC

ACT2 Active Mode with power save status of HV-SLIC (for future use)

ACT2 = 0 normal mode

ACT2 = 1 C1, C2 indicates the power save mode for the HV-SLIC

QIO1D Direction for programmable IO - Pin of the QAP IO1

QIO1D = 0 sets the pin IO1 as an input

QIO1D = 1 sets the pin IO1 as an output

QIO2D Direction for programmable IO - Pin of the QAP IO2

QIO2D = 0 sets the pin IO2 as an input

QIO2D = 1 sets the pin IO2 as an output

Programming the MuSLIC

SCR2 Configuration Register 2

Configuration register SCR2 is the Mask register. Each bit of TCR0 (Signalling register) can be masked (except the RES bit); that means changes of such a 'masked bit' are not causing a change of the SLCX - bit (Data Upstream C/I-channel byte).

Bit 7	6	5	4	3	2	1	0
VB/2M	ICONM	TEMPM	FAILM	MVAM	LSUPM	1	1

Reset value: FF_H

VB/2M Mask bit for half battery information
 VB/2M = 0 each change of the VB/2 bit leads to an interrupt (SLCX-bit)
 VB/2M = 1 changes of VB/2 bit are neglected

ICONM Mask bit for constant current information
 ICONM = 0 each change of the ICON bit leads to an interrupt (SLCX-bit)
 ICONM = 1 changes of ICON bit are neglected

TEMPM Mask bit for over temperature information
 TEMPM = 0 each change of the TEMP bit leads to an interrupt (SLCX-bit)
 TEMPM = 1 changes of TEMP bit are neglected

FAILM Mask bit for clock fail information
 FAILM = 0 each change of the FAIL bit leads to an interrupt (SLCX-bit)
 FAILM = 1 changes of FAIL bit are neglected

MVAM Mask bit for internal measurement results
 MVAM = 0 each change of the MVA bit leads to an interrupt (SLCX-bit)
 MVAM = 1 changes of the MVA bit are neglected

LSUPM Mask bit for line supervision
 LSUPM = 0 each change of the LSUP bit leads to an interrupt (SLCX-bit)
 LSUPM = 1 changes of the LSUP bit are neglected

Information about changing half battery- and constant current- information will be neglected on both of the Power Down and the Ringing state.

Programming the MuSLIC

SCR3 Configuration Register

Bit	7	6	5	4	3	2	1	0
	AG6DB	LIN	LAW	COR8	0	0	0	0

Reset value: 00_H

AG6DB Fixed gain in the transmit path.

AG6DB = 0 0 dB gain

AG6DB = 1 + 6 dB gain

LIN Linear mode selection (16 bit linear information in voice channel A (upper byte) and B (lower byte))

LIN = 0 PCM-mode is selected

LIN = 1 linear mode is selected

LAW PCM-law selection

LAW = 0 A-Law is selected

LAW = 1 μ -Law is selected (μ 255 PCM)

COR8 Cut off receive (voice only)

COR8 = 0 normal operation

COR8 = 1 cut off receive is enabled

SCR4 and SCR5 Configuration Register

These two registers content the DC offset bytes. They can be used one by one. Activation is controlled by the ENO bit (SCR0-2)

SCR4

Bit	7	6	5	4	3	2	1	0
LOW Byte of DC-Offset Compensation								

Reset value: 00_H

SCR5

Bit	7	6	5	4	3	2	1	0
HIGH Byte of DC-Offset Compensation								

Reset value: 00_H

Programming the MuSLIC

STCR0 Test Configuration Register 0

The Test Configuration register STCR0 is used for fuse operation and test only.

Bit 7	6	5	4	3	2	1	0
FUSE3	FUSE2	FUSE1	FUSE0	0	0	0	0

Reset value: 00_H

FUSE0 to FUSE3 Information for fuse operation

STCR1 Test Configuration Register 1

The Test Configuration register STCR1 is used for reserved operations of the PEB 3465 (QAP).

Bit 7	6	5	4	3	2	1	0
RSV5	RSV4	RSV3	RSV2	RSV1	RSV0	RSVU1	RSVU2

Reset value: 00_H

RSV0 to RSV5 from PEB 31665 to PEB 3465

RSVU0 to RSVU1 from PEB 3465 to PEB 31665

Programming the MuSLIC

4.1.2 XOP Command

To modify or evaluate test configurations, to select special functions, to control the coefficient RAMs, to get information for fusing and ECIC and other common functions up to 15 Bytes maybe transferred to or from the MuSLIC, using the XOP Command (extended operation command).

Bit 7	6	5	4	3	2	1	0
0	RW	1	0	ATR	LSEL2	LSEL1	LSEL0

RW Read/Write Information: Enables reading from the MuSLIC or writing information to the MuSLIC

- RW = 0 Write to the MuSLIC
- RW = 1 Read from the MuSLIC

LSEL Length select information.
This field identifies the subsequent data bytes.

ATR	LSEL 2	LSEL 1	LSEL 0	
0	0	0	0	XR0
0	0	0	1	XR1
0	0	1	0	XR2
0	0	1	1	AC-RAM + DC-RAM Checksum
0	1	0	0	AC-RAM Checksum
0	1	0	1	DC-RAM Checksum
0	1	1	0	ECIC1 (0 to 14)
0	1	1	1	ECIC2 (15 to 29)
1	0	0	0	XTR0
1	0	0	1	XTR1 and XTR2
1	0	1	0	XTR0 to XTR8
1	0	1	1	Fuse register 0 to Fuse register 1
1	1	0	0	Blocktest 1 to Blocktest 3
1	1	0	1	XTR14 to XTR17
1	1	1	0	RESERVED
1	1	1	1	RESERVED

Programming the MuSLIC

XR0 Extended Operation Register 0

Extended Operation Register 0 defines the four IO-pins of the MuPP.

Bit	7	6	5	4	3	2	1	0
	MIO4D	MIO3D	MIO2D	MIO1D	MIO4	MIO3	MIO2	MIO1

Reset value: 00_H

MIOiD Direction for programmable IO - Pins of the MuPP IO1 to IO4

MIOiD = 0 sets the pin IOi as an input

MIOiD = 1 sets the pin IOi as an output

MIOi Value of programmable IO - Pins of the MuPP IO1 to IO4

MIOi = 0 sets the pin IOi to LOW or if it is read it is LOW

MIOi = 1 sets the pin IOi to HIGH or if it is read it is HIGH

If the bit REXTEN (XR2-7) is set to 1 (Unbalanced Ringing) the MIO1 pin is switched to the ring pulse control function. Thus a zero-crossing signal connected to the MIO1 (combined with the Ringing Mode, burst on/off) generates a correct switching signal for the ringer relay sent on QIO1 of the selected subscriber line (see **chapter 4.2** and **chapter 5.5**).

If the bit EX-MCLK (XR2-2) and TST1 pin (No.26) are set to 1 and the MIO2 pin is set as an input the MuPP is ready for external clocking (32 MHz) (the internal PLL is shut down).

If the TST1 pin (No.26) and the bit EX-MCLK (XR-2) is set to 1 and the MIO2 pin is set as an output the 32 MHz clock (output of the internal PLL) is on the MIO2 pin.

Programming the MuSLIC

XR1 Extended Operation Register 1

Extended Operation Register 1 defines the Data Upstream Persistency Counters.

Reset value: 5A_H

DUPGNK To restrict the rate of upstream C/I-bit changes, deglitching (persistence checking) of the status information from the MuSLIC may be applied. New status information will be transmitted upstream, after it has been stable for N milliseconds. N is binary programmable in the range of 4 to 60 ms in steps of 4 ms, with DUPGNK = 0_H the deglitching is disabled.

Reset value is 20 ms.

The HOOK bit (for external indication) and the GNK bit are influenced.

(Detailed info see **chapter 4.2**, and **figure 23**.)

DUP To restrict the rate of upstream C/I-bit changes, deglitching (persistence checking) of the status information from the MuSLIC may be applied. New status information will be transmitted upstream, after it has been stable for N milliseconds. N is binary programmable in the range of 1 to 15 ms in steps of 1 ms; with DUP = 0h the deglitching is disabled.

Reset value is 10 ms.

The HOOK, SLCX and the QI1-bits are influenced (different counters but same programming).

(Detailed info see **chapter 4.2**, and **figure 23**.)

Programming the MuSLIC

XR2 Extended Operation Register 2

Extended Operation Register 2 defines basic operations for all channels.

Bit 7	6	5	4	3	2	1	0
REXTEN	0	0	FIXC	IDR	EX-MCLK	0	0

Reset value: 10_H

REXTEN External Ringing Mode Enabled (see **chapter 5.5**)

REXTEN = 0 use internal ringing mode

REXTEN = 1 use external ringing mode

FIXC The MuSLIC uses either fixed coefficients or the programmed ones.

FIXC = 0 programmed coefficients used

FIXC = 1 fixed coefficients used

IDR Initializes Data RAM

IDR = 0 normal operation is selected

IDR = 1 content of Data RAM is set to 0 (for test purposes)

EX-MCLK Possibility to provide the MuSLIC with an external clock (see XR0)

EX-MCLK = 0 normal operation is selected

EX-MCLK = 1 internal PLL is shut down or internal clock is connected to the pin MIO2, respectively (see XR0)

Programming the MuSLIC

XR3 TO XR6 Extended Operation Registers 3 to 6

XR3 to XR6 are the checksums of all the Coefficient bytes written into the Coefficient RAM (CRAM) of the MuPP by the COP-Command. Reading these bytes starts the sum generation. There are two identical blocks of CRAMs (time slot 0 to 7 and 8 to 15). Each reading alternates the block access.

XR3

XR4

XR5

XR6

(Algorithm of defining the checksum: $x^{16} + x^{10} + x^7 + x + 1$)

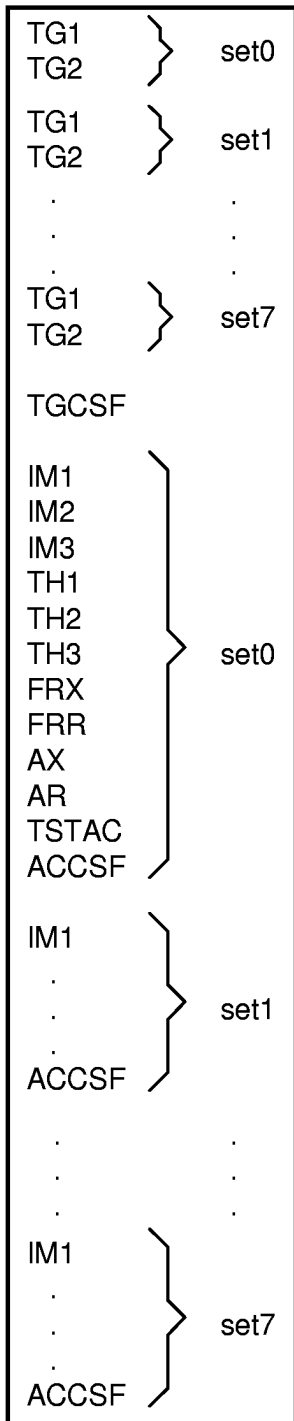

(With that algorithm you can reach a fault coverage of: $1-2^{-15}$)

Programming the MuSLIC

Sum generation is done in the following manner (see **chapter 4.1.4**)

AC-CRAM-Checksum

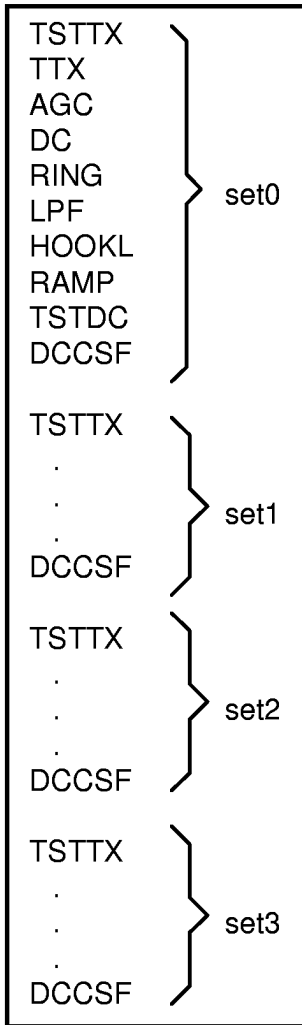

The sequence of the coefficients is:

Programming the MuSLIC

DC-RAM-Checksum

The sequence of the coefficients is:

Using the “checksum fill” Bytes (TGCSF, ACCSF, DCCSF) it is possible to create a fixed set-checksum independent of changed coefficients.

Programming the MuSLIC

XR7 and XR8 Extended Operation Register 7 to 8

Each of these two registers feasible to read 15 bytes of design/status information generated by an external ASIC. More details about the extended IOM-2 Channel Identification see **chapter 10**.

XR7

XR8

XR7 and XR8 shows the data stream of the input pin ID0. If the input pins ID1, ID2 and ID3 = 1, ID0 works as a serial input controlled by FSC and DCL (see **chapter 10**).

Reading XR7 or XR8 15 bytes each will be transferred from ID0 to IOM-2 Interface Monitor channel.

XTR0 Extended Operation Test Register 0

Extended Operation Test Register XTR0 defines testing features.

Reset value: 00_H

HIT for AHV-SLIC test functions
 HIT = 0 normal operation
 HIT = 1 changes HV-interface (C1,C2) which set the TIP wire to high impedance

HIR for AHV-SLIC test functions
 HIR = 0 normal operation
 HIR= 1 changes HV-interface (C1,C2) which set the RING wire to high impedance

Programming the MuSLIC

ELM	Enable level meter
ELM = 0	normal operation if LM2PCM = 1 the input to the Levelmeter is switched to PCM Voice-Channel
ELM = 1	level meter function is enabled if LM2PCM = 1 the output of the Levelmeter is switched to PCM Voice-Channel
SOFTON	SW-fuses are activated in the PEB 3465
SOFTON = 0	HW-fuses are activated
SOFTON = 1	SW-fuses are activated
OPIM8M	Open fast digital Impedance Matching Loop (IM8M)
OPIM8M = 0	normal operation
OPIM8M = 1	opens fast digital IM-Loop ($H_{IM8M} = 0$)
DLP03	Disable LP03-lowpass
DLP03 = 0	normal operation
DLP03 = 1	disables programmable lowpass ($H_{LP03} = 1$)
DLP5	Disable LP5-lowpass
DLP5 = 0	normal operation
DLP5 = 1	disables programmable lowpass ($H_{LP5} = 1$)
DISPOFI	Disable Postfilter (DC path)
DISPOFI = 0	normal operation
DISPOFI = 1	disables postfilter

Programming the MuSLIC

XTR1 Extended Operation Test Register 1

XTR1 controls the level meter functions

Bit 7	6	5	4	3	2	1	0
CAL	LMSEL1	LMSEL0	LMNOTCH	LMBP	LM2PCM	PCM2DC	ITIME

Reset value: 00_H

CAL Enable level meter result register
 CAL = 0 normal operation (offset register - SCR4/SCR5 - is read)
 CAL = 1 levelmeter result register is read

LMSEL selects Levelmeter and Thresholdpairs

LMSEL1	LMSEL0	
0	0	DC-Levelmeter Thresholdpair 0
0	1	DC-Levelmeter Thresholdpair 1
1	0	AC-Levelmeter
1	1	TTX-Levelmeter

LMNOTCH Bandpass or Notchfilter Function for Levelmetering AC
 LMNOTCH = 0 Bandpass Function
 LMNOTCH = 1 Notchfilter Function

LMBP Activates the Bandpass or Notchfilter in the AC Transmit Path
 LMBP = 0 normal operation
 LMBP = 1 Bandpass/Notchfilter enabled

LM2PCM Switches the selected Levelmeter Signal to the PCM Voice-Channel
 LM2PCM = 0 normal operation
 LM2PCM = 1 switches the selected Levelmetersignal to the PCM Voice-Channel

PCM2DC switches the Receive PCM Voice-Channel to DC-Output
 PCM2DC = 0 normal operation
 PCM2DC = 1 switches the Receive PCM Voice-Channel to DC-Output

ITIME Integration time of AC and TTX Levelmeter
 ITIME = 0 16 ms Integrationtime
 ITIME = 1 256 ms Integrationtime

Programming the MuSLIC

XTR2 Extended Operation Test Register 2

Extended Operation Test Register XTR2 defines testing features (see **chapter 8**).

Bit	7	6	5	4	3	2	1	0
	RING-ON	DDCC	DCAD16	ERAMP	ERECT	AC-ADCPD	AC-DACPD	AFE-OFF

Reset value: 00_H

- RING-ON** Interrupt DC-characteristic and enables the Ringing Offset
 RING-ON = 0 normal operation
 RING-ON = 1 Interrupts DC-loop (HDCC = 0) and enables the Ringing Offset

- DDCC** Disable DC-characteristic
 DDCC = 0 normal operation
 DDCC = 1 disables DC-loop (HDCC = 1)

- DCAD16** DC gain of 16 in AD direction
 DCAD16 = 0 normal operation
 DCAD16 = 1 gain of 16

- ERAMP** Enable Ramping generator
 ERAMP = 0 ramping generator off
 ERAMP = 1 ramping generator on

- ERECT** Enable rectifier in DC-levelmeter
 ERECT = 0 normal operation (HRECT = 1)
 ERECT = 1 enables rectifier

- AC-ADCPD** ADC is set to power down (transmit path is opened)
 AC-ADCPD = 0 normal operation
 AC-ADCPD = 1 transmit path is inactive

- AC-DACPD** DAC is set to power down (receive path is opened)
 AC-DACPD = 0 normal operation
 AC-DACPD = 1 receive path is inactive

- AFE-OFF** Analog front end is activated or deactivated
 AFE-OFF = 0 normal operation
 AFE-OFF = 1 the analog front end is deactivated

Programming the MuSLIC

XTR3 Extended Operation Test Register 3

Extended Operation Test Register XTR3 defines the basic MuSLIC settings which enable / disable the programmable digital filters.

Bit 7	6	5	4	3	2	1	0
DHP-X	DHP-R	TH	FRX	FRR	AX	AR	IM

Reset value: 00_H

- DHP-X** Disable Transmit Highpass for test reasons
 DHP-X = 0 Transmit Highpass Filter is enabled
 DHP-X = 1 Transmit Highpass Filter is disabled

- DHP-R** Disable Receive Highpass for test reasons
 DHP-R = 0 Receive Highpass Filter is enabled
 DHP-R = 1 Receive Highpass Filter is disabled

- TH** Set Transhybrid Balancing Filter - together with the bit FIXC (XR2-4).
 For FIXC = 1: the TH-Filter is set to $H_{TH} = \text{for } Z_{BRD}$;
 For FIXC = 0:
 TH = 0 TH-filter is disabled
 TH = 1 TH-filter is enabled (use programmed values)

- FRX** Enable FRX- (Frequency Response Transmit) Filter
 For FIXC = 0:
 FRX = 0 FRX-filter is disabled ($H_{FRX} = 1$)
 FRX = 1 FRX-filter is enabled (use programmed values)

- FRR** Enable FRR- (Frequency Response Receive) Filter
 For FIXC = 0:
 FRR = 0 FRR-filter is disabled ($H_{FRR} = 1$)
 FRR = 1 FRR-filter is enabled (use programmed values)

- AX** Set AX- (Amplification/Attenuation Transmit) Filter
 For FIXC = 0:
 AX = 0 AX-filter is set to default value ($H_{AX} = 10 \text{ dB}$)
 AX = 1 AX-filter is enabled (use programmed values)

- AR** Set AR- (Amplification/Attenuation Receive) Filter
 For FIXC = 0:
 AR = 0 AR-filter is set to default value ($H_{AR} = -15.11 \text{ dB}$)
 AR = 1 AR-filter is enabled (use programmed values)

- IM** Activates or deactivates the 64 kHz filter
 IM = 0 64 kHz filter is deactivated ($H_{IM} = 0$)
 IM = 1 64 kHz filter is activated

Programming the MuSLIC

XTR4 Extended Operation Test Register 4

Extended Operation Test Register XTR4 defines testing features.

Bit	7	6	5	4	3	2	1	0
	DLB-8M	DLB-64K	DLB-32K	DLB-PCM	ALB-8M	ALB-64K	ALB-8K	DCHOLD

Reset value: 00_H

- DLB-8M** AC digital loop: 8 MHz in/output is short cut
 DLB-8M = 0 normal operation
 DLB-8M = 1 8 MHz in/output is short cut
- DLB-64K** AC digital loop: 64 kHz in/output is short cut
 DLB-64K = 0 normal operation
 DLB-64K = 1 64 kHz in/output is short cut
- DLB-32K** AC digital loop: 32 kHz in/output is short cut
 DLB-32K = 0 normal operation
 DLB-32K = 1 32 kHz in/output is short cut
- DLB-PCM** AC digital loop: PCM in/output is short cut
 DLB-PCM = 0 normal operation
 DLB-PCM = 1 PCM in/output is short cut
- ALB-8M** AC analog loop: 8 MHz in/output is short cut
 ALB-8M = 0 normal operation
 ALB-8M = 1 8 MHz short cut
- ALB-64K** AC analog loop: 64 kHz in/output is short cut
 ALB-64K = 0 normal operation
 ALB-64K = 1 64 kHz in/output is short cut
- ALB-8K** AC analog and digital loops:
 ALB-8K = 0 normal operation
 ALB-8K = 1 and ALB-8M = 0 8 kHz loop in the AC DSP
 (AC digital loop)
 ALB-8K = 1 and ALB-8M = 1 Pre-/Postfilter out/input is short cut
 (AC analog loop)
- DCHOLD** Holds the current DC-Output
 DCHOLD = 0 normal operation
 DCHOLD = 1 DC-Output is held

Programming the MuSLIC

XTR5 Extended Operation Test Register 5

XTR5 defines testing functions

Bit 7	6	5	4	3	2	1	0
DC-DLB	DC-ALB	DC-ALBIT	DC-ALBIL	DC-ALBV	DCLMU2	DCLMU1	DCLMU0

Reset value: 00_H

DC-DLB DC digital loop: 1 MHz in/output is short cut
 DC-DLB = 0 normal operation
 DC-DLB = 1 1 MHz in/output is short cut

DC-ALB DC analog loop:
 DC-ALB = 0 normal operation
 DC-ALB = 1 short cut of in/output of DC-ADC and DC-DAC

DC-ALBIT DC analog loop: IT is switched to DCP/DCN
 DC_ALBIT = 0 normal operation
 DC_ALBIT = 1 IT is switched to DCP/DCN

DC-ALBIL DC analog loop: IL is switched to DCP/DCN
 DC_ALBIL = 0 normal operation
 DC_ALBIL = 1 IL is switched to DCP/DCN

DC-ALBV DC analog loop: VA, VB, VBIM, VDDIM is switched to DCP/DCN
 DC_ALBV = 0 normal operation
 DC_ALBV = 1 VA, VB, VBIM, VDDIM is switched to DCP/DCN

DCLMU Selects the signal switched to the DC-Levelmeter

DCLMU2	DCLMU1	DCLMU0	
0	0	0	IT
0	1	0	IL
1	0	0	VA
1	0	1	VB
1	1	0	VBIM
1	1	1	VDDIM

Programming the MuSLIC

XTR6 Extended Operation Test Register 6

XTR6 defines testing functions

Bit 7	6	5	4	3	2	1	0
TTXL	DTTXL	NOAGC	ILITMUX	COT16	DITOFF	AXG0	ARG0

Reset value: 00_H

- TTXL** Enables current measurement for TTX
 TTXL = 0 normal operation
 TTXL = 1 and IM = 1 and OPIM8M=1 enables TTX current measurement
- DTTXL** Analog testloop: input/output is shortcut
 DTTXL = 0 normal operation
 DTTXL = 1 input/output is shortcut t
- NOAGC** disable automatic gain control for TTX
 NOAGC = 0 normal operation
 NOAGC = 1 disable automatic gain control
- ILITMUX** IL changes to IT and vice versa
 ILITMUX = 0 normal operation
 ILITMUX = 1 IL changes to IT and vice versa
- COT16** cut off transmit path
 COT16 = 0 normal operation
 COT16 = 1 cut off transmit path
- DITOFF** Disables the dither for noiseshapers
 DITOFF = 0 normal operation
 DITOFF = 1 Dither disabled
- AXG0** 0 dB Gain for Transmit Path
 AXG0 = 0 normal operation
 AXG0 = 1 0 dB Gain for Transmit Path
- ARG0** 0 dB Gain for Receive Path
 ARG0 = 0 normal operation
 ARG0 = 1 0 dB Gain for Receive Path

Programming the MuSLIC

XTR7 Extended Operation Test Register 7

XTR7 informs how many PEB 3465 are connected to the PEB 31665

Bit	7	6	5	4	3	2	1	0
	QDETQ4	QDETQ3	QDETQ2	QDETQ1	0	0	0	0

Reset value: 00_H

- QDETQ4** informs about PEB 3465 connection
- QDETQi = 0** there is no PEB 3465 connected to the i-th interface
 - QDETQi = 1** there is a PEB 3465 connected to the i-th interface

Note: This information is available after the first AFSC-pulse.

Programming the MuSLIC

XTR8 Extended Operation Test Register 8

XTR8 defines testing functions

Bit 7	6	5	4	3	2	1	0
TQAP-FIR3	TQAP-FIR2	TQAP-FIR1	TQAP-FIR0	0	0	0	ENRSV

Reset value: 00_H

- TQAP-FIR3** Disables Noiseshaping Function for Channel 9, 11, 13, 15
 TQAP-FIR3 = 0 normal operation
 TQAP-FIR3 = 1 Noiseshaping Function is disabled
- TQAP-FIR2** Disables Noiseshaping Function for Channel 8, 10, 12, 14
 TQAP-FIR2 = 0 normal operation
 TQAP-FIR2 = 1 Noiseshaping Function is disabled
- TQAP-FIR1** Disables Noiseshaping Function for Channel 1, 3, 5, 7
 TQAP-FIR1 = 0 normal operation
 TQAP-FIR1 = 1 Noiseshaping Function is disabled
- TQAP-FIR0** Disables Noiseshaping Function for Channel 0, 2, 4, 6
 TQAP-FIR0 = 0 normal operation
 TQAP-FIR0 = 1 Noiseshaping Function is disabled
- ENRSV** Enables Reserved Registers (STCR1, XTR14 to XTR17)
 ENRSV = 0 normal operation
 ENRSV = 1 reserved registers are enabled

XTR9 to XTR10 Extended Operation Test Register 9 and 10

These bytes are used for the fuse operation of the PEB 3465.

Reset value: 00_H

Programming the MuSLIC

XTR10

Reset value: 00_H

XTR11 to XTR13 Extended Operation Test Register 11 to 13

These 3 bytes show the result of the test of internal function blocks.

XTR11

Reset value: 00_H

XTR12

Reset value: 00_H

XTR13

Reset value: 00_H

*Note: Write XTR11 with bit 0 = 1 starts the blocktests. There are several types of tests. Selection is done by the bits 1 to 7 of XTR11 (see **chapter 8**).*

XTR14 to XTR16 Extended Operation Test Register 14 to 16

XTR14 to XTR16 are reserved for transfer of information from the PEB 31665 to the PEB 3465.

Reset value: 00_H

Programming the MuSLIC

XTR17 Extended Operation Test Register 17

XTR17 is reserved for transfer of information from the PEB 3465 to the PEB 31665.

Reset value: 00_H

4.1.3 TOP Command

With the TOP Command the TCR0 and TCR1 registers can be read. Each channel has its own registers addressed by the time slot or by address

Bit	7	6	5	4	3	2	1	0
	0	R	1	1	0	0	LSEL1	LSEL0

R Read Information: Enables reading from the MuSLIC

R = 0 No operation

R = 1 Read from MuSLIC

LSEL Length select information

This field identifies the number of the TCR Register and the handling of interrupts too.

LSEL 1	LSEL 0	
0	0	TCR0 (Reset of the interrupt)
0	1	TCR1 (Not masked interrupts are not affected)
1	1	TCR0 and TCR1 (Reset of the interrupt)

Programming the MuSLIC

TCR0 Configuration Register 0

TCR0 is the Signalling register. It indicates status information of each channel. If there is any change of one or more bits it is indicated via the SCLX bit in the C/I-channel. Each bit, except the RES bit, can be masked by the SCR2 Register (see also **figure 23**).

Bit 7	6	5	4	3	2	1	0
VB/2	ICON	TEMP	FAIL	MVA	LSUP	RES	0

Reset value: 02_H

- VB/2** Half battery voltage is detected
interrupt masked in Power Denial and Ringing State
VB/2 = 0 line voltage smaller than half battery
VB/2 = 1 line voltage larger than half battery
- ICON** Current limitation information
interrupt masked in Power Denial and Ringing State
ICON = 0 Resistive Feeding
ICON = 1 Constant Current Feeding
- TEMP** Temperature alarm of the AHV-SLIC which is signalled through the HV-SLIC Interface (see **chapter 3.4**)
TEMP = 0 normal temperature
TEMP = 1 Temperature alarm from AHV-SLIC detected
- FAIL** DCL or FSC Fail: Not the right count of clock cycles between two frame syncs
FAIL = 0 no clock fails are detected
FAIL = 1 clock fails are detected
The FAIL bit is not influenced by the DUP-counter (each failure is reported).
- MVA** Internal measurement results shown in the TCR1-0 and TCR1-1 are valid or not valid (see **chapter 8**)
MVA = 0 the level metering results are not valid
MVA = 1 the level metering results are valid
- LSUP** Line Supervision (of broken line)
LSUP = 0 the transversal current is higher than the programmed level
LSUP = 1 the transversal current is lower than the programmed level
- RES** Reset status
RES = 0 no Reset has occurred
RES = 1 Reset has occurred via Reset-pin or via Power on Reset

Programming the MuSLIC

Any change of these bits (except the FAIL bit: only the positive going is reported) is signalled via the interrupt-bit (SLCX) in the C/I-DU-channel. There are two types of generating an interrupt:

- Each toggling of a non-masked TCR0-bit combined with a DUP-counter
- Toggling of the non-masked TEMP or MVA-bit and positive going FAIL bit (no filtering by the DUP-counter)

The status information is stored in the TCR0-register and an interrupt is generated but only if there isn't a not-handled interrupt.

Reading the TCR0-register gives the frozen interrupt status, clears the interrupt and enables the signalling of a further interrupt but not until after at least two 8 kHz frames.

*Note: The HOOK and the GNK signalling are directly filtered by there own DUP(GNK)-counters and they are directly put into the C/I-DU-channel (see **chapter 4.2**).*

TCR1 Configuration Register 1

TCR1 indicates interrupt information and level meter results of one channel.

Bit 7	6	5	4	3	2	1	0
NMVB/2	NMICON	NMTEMP	NMFAIL	NMMVA	NMLSUP	RLM1	RLM0

Reset value: 00_H

NMVB/2 to NMLSUP Not masked signalling information. (The meaning of each bit is the same as described above.)
 Reading this register won't affect any stored information.

RLM1 and RLM0 Result Level Metering

RLM1	RLM0	
0	0	below both levels
x	1	above level 0
1	x	above level 1

Programming the MuSLIC

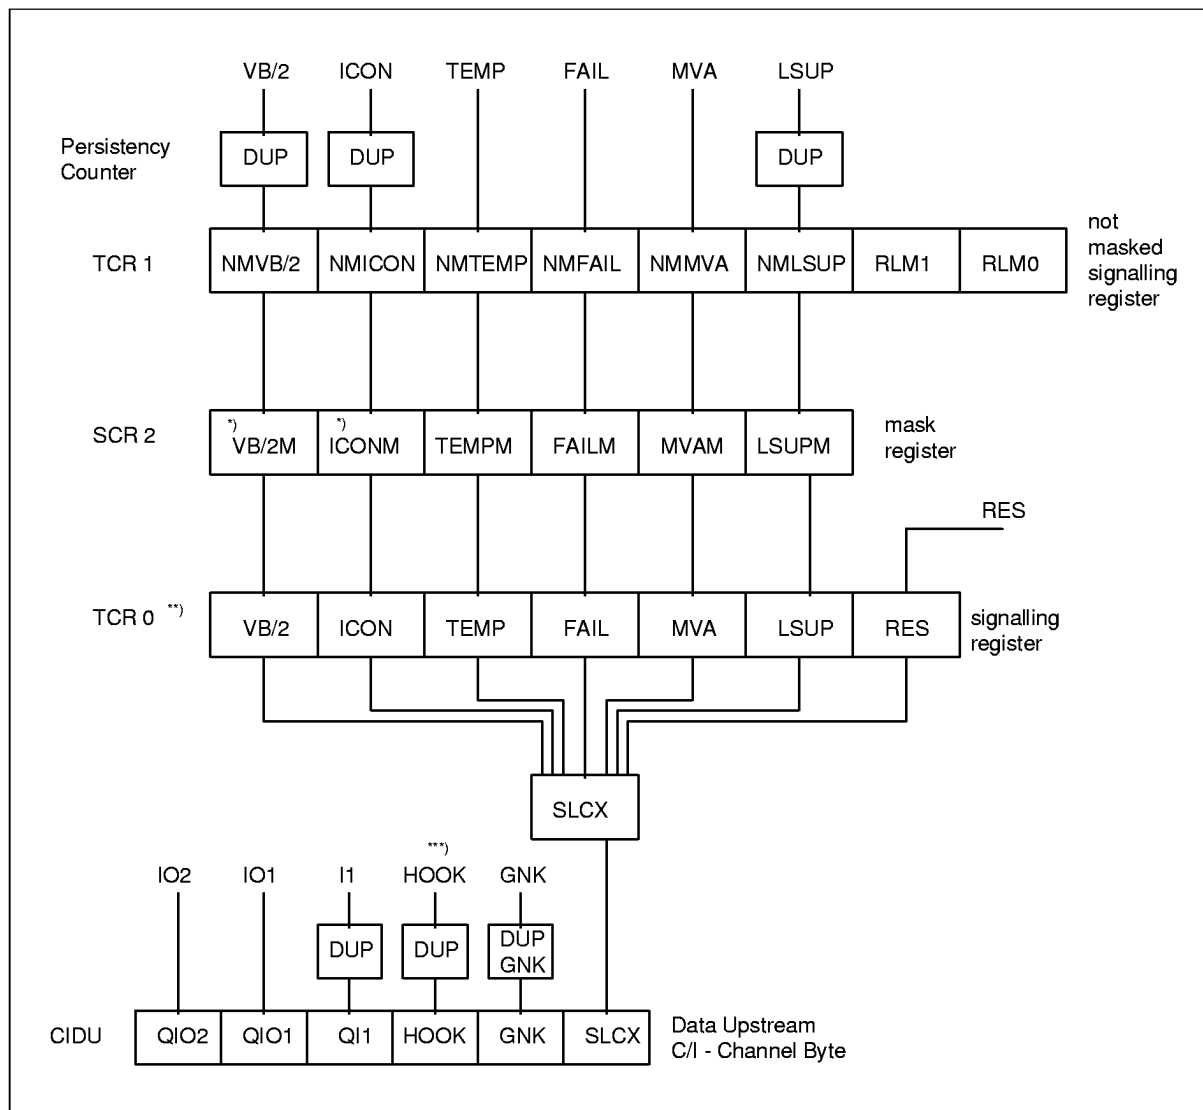

Figure 23 Interrupt Logic (block structure)

- 1) In Power Down and Ringing Mode changes of VB/2 and ICON are masked.
- 2) TCR0 is locked if one of the signals changes and is enabled after reading. Each change of TCR0 sets the interrupt bit SLCX to 1. Reading TCR0 sets SLCX to 0 but not before two 8 kHz frames. A take over of the signal FAIL from TCR1 to TCR0 clears this signal in TCR1.
- 3) In Power Down Mode the persistency counter DUPGNK is used.

Programming the MuSLIC

4.1.4 COP Command

With a COP Command coefficients for the programmable filters can be written to or read from the MuSLIC (write access is only allowed if FIXC = 1 or to an unused SET).

(Filter optimizing to different applications is supported by the software package MuSLICOS.)

The coefficients are gathered to 8 and 4 SETS respectively. So an optimum is reached between supplying each channel, handling and memory space. **Figure 24** gives an overview of the Coefficient RAM structure.

To assign a SET to a channel the COPI command is used.

Bit 7	6	5	4	3	2	1	0
ICRAM	RW	0	0	0	1	WGRAM1	WGRAM0

Bit 7	6	5	4	3	2	1	0
SET2	SET1	SET0	CODE 4	CODE 3	CODE 2	CODE 1	CODE 0

ICRAM Initialize CRAM
 ICRAM = 0 Only one coefficient is programmed (destination is coded in the following byte)
 ICRAM = 1 the whole AC- or DC-CRAM is written with the information of the following byte

RW Read/ Write
 RW = 0 Subsequent data is written to the MuSLIC
 RW = 1 Read data from the MuSLIC

WGRAM1 and WGRAM0 Write to CRAM (only valid in combination with ICRAM=1)

WGRAM1	WGRAM0	
0	0	no write
0	1	AC-CRAM
1	0	DC-CRAM
1	1	AC-CRAM and DC-CRAM

Programming the MuSLIC

SET	includes the number of coefficient set			
	SET2	SET1	SET0	
	0	0	0	SET 0
	0	0	1	SET 1
	0	1	0	SET 2
	0	1	1	SET 3
	1	0	0	SET 4
	1	0	1	SET 5
	1	1	0	SET 6
	1	1	1	SET 7

SET 0 to SET 7 for the 8 sets of AC-coefficients and the 8 sets of Tone Generator 1 and 2

SET 0 to SET 3 for the 4 sets of DC-coefficients

Programming the MuSLIC

CODE includes the number of following bytes and filter-addresses¹⁾

CODE4	CODE3	CODE2	CODE1	CODE0		
0	0	0	0	0	TH-Filter coefficients (part 1)	(followed by 8 bytes of data)
0	0	0	0	1	TH-Filter coefficients (part 2)	(followed by 8 bytes of data)
0	0	0	1	0	TH-Filter coefficients (part 3)	(followed by 8 bytes of data)
0	0	0	1	1	FRX-filter coefficients	(followed by 8 bytes of data)
0	0	1	0	0	FRR-filter coefficients	(followed by 8 bytes of data)
0	0	1	0	1	AX-filter coefficients	(followed by 8 bytes of data)
0	0	1	1	0	AR-filter coefficients	(followed by 8 bytes of data)
0	0	1	1	1	TG1-filter coefficients	(followed by 8 bytes of data)
0	1	0	0	0	TG2-filter coefficients	(followed by 8 bytes of data)
0	1	0	0	1	AC test coefficients	(followed by 8 bytes of data)
0	1	0	1	0	IM-filter coefficients (part 3)	(followed by 8 bytes of data)
0	1	0	1	1	IM-filter coefficients (part 1)	(followed by 8 bytes of data)
0	1	1	0	0	IM-filter coefficients (part 2)	(followed by 8 bytes of data)
0	1	1	0	1	TG CSF (checksum fill)	(followed by 8 bytes of data)
0	1	1	1	0	AC CSF (checksum fill)	(followed by 8 bytes of data)
1	0	0	0	0	TTX test coefficients	(followed by 8 bytes of data)
1	0	0	0	1	TTX coefficients	(followed by 8 bytes of data)
1	0	0	1	0	AGC coefficients	(followed by 8 bytes of data)
1	0	0	1	1	LP-filter coefficients	(followed by 8 bytes of data)
1	0	1	0	0	Hook level coefficients	(followed by 8 bytes of data)
1	0	1	0	1	DC test coefficients	(followed by 8 bytes of data)
1	0	1	1	0	Ringing coefficients	(followed by 8 bytes of data)
1	0	1	1	1	DC-characteristic coefficients	(followed by 8 bytes of data)
1	1	0	0	0	Ramp generator, Ringer delay coefficients	(followed by 8 bytes of data)
1	1	0	0	1	DC CSF (checksum fill)	(followed by 8 bytes of data)

¹⁾ For generating a correct checksum all not used bits must be set to 0.

Programming the MuSLIC

4.2 IOM[®]-2 Interface Command / Indication Byte

The Command/Indication (C/I) channel is used to communicate real time status information and for fast controlling of the MuSLIC. Data on the C/I channel are continuously transmitted in each frame until new data is sent.

Data Downstream C/I - Channel Byte (receive) - CIDD

This Byte is used for fast controlling of the MuSLIC. Each transfer to the MuSLIC has to last for at least 2 consecutive frames (FSC-cycles) so that it is accepted internally. Changes (spikes) of less than 2 FSC cycles are neglected.

(Note that there is no address DD direction because there is only one MuPP.)

Bit	7	6	5	4	3	2
	QIO2	QIO1	QO1	M2	M1	M0

M0, M1, M2 these bits define the actual status; see table below (for details see **chapter 5**)

M2	M1	M0	Description
0	0	0	Power-Down High Impedance (loop open, PDNH)
1	1	1	Power-Down Resistive (loop open, PDNR)
0	1	0	Active State
1	1	0	Active State with Meterpulses
1	0	0	Ground Start
0	0	1	Ringling State (ring pause)
1	0	1	Ringling State (ring burst on)

QO1 Value for the fixed Output Pin O1 of the QAP.

QO1 = 0 The corresponding pin at the digital interface of the QAP is set to a logic 0.

QO1 = 1 The corresponding pin at the digital interface of the QAP is set to a logic 1.

Note: The Output Pin O1 of the QAP is tristate after reset and will be enabled by the first SOP command.

Programming the MuSLIC

QIO1 Value for the programmable Input/Output Pin IO1 of the QAP if programmed as an output pin. If the bit REXTEN (XR2-7) is set to 1 (external ringing) the internally created Ring Burst On Signal (for an external relay driver) **chapter 5.5)**

QIO1 = 0 The corresponding pin at the digital interface of the QAP is set to a logic 0.

QIO1 = 1 The corresponding pin at the digital interface of the QAP is set to a logic 1.

QIO2 Value for the programmable Input/Output Pin IO2 of the QAP if programmed as an output pin.

QIO2 = 0 The corresponding pin at the digital interface of the QAP is set to a logic 0.

QIO2 = 1 The corresponding pin at the digital interface of the QAP is set to a logic 1.

Data Upstream C/I - Channel Byte (transmit) - CIDU

This Byte is used for fast transfer of the most important and time critical informations from the MuSLIC. Each transfer from the MuSLIC lasts for at least 2 consecutive frames.

(Note that there is no address in DU direction too.)

Bit	7	6	5	4	3	2
	QIO2	QIO1	QI1	HOOK	GNK	SLCX

SLCX Interrupt bit: Summary output of the whole signalling register (TCR0).

SLCX = 0 No unmasked bit in the signalling register has toggled.

SLCX = 1 Any unmasked bit in the signalling register has toggled.

GNK Indication if a ground connection is detected (filtered via the DUPGNK-counter). The function is disabled in Power Down State (GNK is set to 0).

GNK = 0 No ground connection was detected.

GNK = 1 Ground connection was detected.

HOOK Indication of the loop condition (filtered via the DUP-counter or the DUPGNK-counter in Power Down State).

HOOK = 0 Subscriber is Onhook.

HOOK = 1 Subscriber is Offhook.

QI1 Logical state of the Input Pin I1 of the QAP.

QI1 = 0 The corresponding pin at the digital interface of the QAP is receiving a logic 0.

QI1 = 1 The corresponding pin at the digital interface of the QAP is receiving a logic 1.

Programming the MuSLIC

- QIO1** Logical state of the programmable Input/Output Pin IO1 of the QAP - even if not programmed as an input pin. ¹⁾
- QIO1 = 0 The corresponding pin at the digital interface of the QAP is receiving a logic 0.
- QIO1 = 1 The corresponding pin at the digital interface of the QAP is receiving a logic 1.
- QIO2** Logical state of the programmable Input/Output Pin IO2 of the QAP - even if not programmed as an input pin.
- QIO2 = 0 The corresponding pin at the digital interface of the QAP is receiving a logic 0.
- QIO2 = 1 The corresponding pin at the digital interface of the QAP is receiving a logic 1.

¹⁾ If the Input/Output Pin is programmed as an output the corresponding bit in the CIDU is "1".

The DUP- (DUPGNK-)counters filter the status-information and the input I1. The counters count down and generate enable signals for the registers if they are zero. Then they start counting again at the programmed value. If a status information or the input signal changes the proper counter is set and continues counting down. There are DUP-counters for HOOK, VB/2, ICON, LSUP generating SLCX and the input pin I1 and one DUPGNK-counter for HOOK in Power Down mode or for GNK in all other modes. Changing the mode freezes the actual status of HOOK and sets the actual HOOK-counter.

Operating Modes

5 Operating Modes

The MuSLIC supports 3 different Operating Modes: Power Down (PDown), Active and Ringing which are controlled via the lower 3 bits of the Data Downstream C/I Channel Byte (CIDD).

Table 7

M2 (CIDD-4)	M1 (CIDD-3)	M0 (CIDD-2)	Description
0	0	0	Power-Down High Impedance (PDNH)
1	1	1	Power-Down Resistive (PDNR)
0	1	0	Active State
1	1	0	Active State with Meterpulses
1	0	0	Active State with Ground Start
0	0	1	Ringing State (ring pause)
1	0	1	Ringing State (ring burst on)

Operating Modes

1	1	0	For testing only; Active State with or without Meterpulses	0	1	1			X			X							HIRT		

5.1 Reset Behavior

The MuSLIC has 2 different reset sources that are internally connected.

The **Reset pins**, which work totally asynchronously to the external clocks.

Power On Reset.

If internal VDD gets above typ. 2.33 V the MuPP is reset by Power On Reset.

Both sources set the MuSLIC to the basic setting modes (see below).

After a reset caused by any of the sources mentioned above, the reset bit (TCR0-1 = RES) is set to one and the SLCX-interrupt (CIDU-2) is set. Reading the TCR0 register clears the interrupt and the RES-bit.

The Reset pin (RESET) of the MuPP and the QAP has a Schmitt-Trigger input to reduce the sensitivity for spikes. In addition the pin RESET has a spike rejection. All spikes smaller than typ. 70 ns are neglected. The pin RESET can be set to 1 for an unlimited time but at least 2 μ s is recommended; during that, the DU pin is set to high impedance. The μ C-IO pins are set as inputs.

In the MuPP a reset activates the reset routine - but only if the DCL is present - which lasts at least two 2 kHz frame (AFSC) periods for setting the default values. After this time and if an external reset is not active (RESET = 0) the MuPP starts the normal (default) operation at the beginning of the next 8 kHz frame (FSC).

In the QAP a reset works totally asynchronously and no reset routine is necessary.

The normal (default) operation of the QAP starts at the beginning of a 2 kHz frame (ASFC) if the external reset (RESET = 0) is released.

5.2 Basic Setting Modes

After RESET, the MuSLIC is switched automatically to its basic settings in which internal default values for all filters and settings (AC and DC) are used. The whole module works in a kind of "emergency mode" and can be handled by the C/I-Interface commands only. This means that for an (un-)determined reset (e.g. Power On Reset) the MuSLIC is reset, but can be switched to or return automatically into any operating mode presented by the C/I-channel after 2 AFSC + 2 FSC cycles. In all modes the outputs (QO_i) become tristate up to the first SOP Command, the I/Os (MIO_i , QIO_i) become inputs, supervision and DC-feeding are still working and conversation can go on in a proper way until all filters and settings have been reloaded by SOP, XOP and COP Commands.

Actions initialized by a reset:

- All configuration registers are set to their default values (note that the Coefficient RAM is **not** reset)
- The RES-bit (TCR0-1) is set to 1 to indicate that a reset has taken place
- The IOM-2 and the μ C-interface is reset. Running communication is stopped
- DU is in high impedance state
- AC- and DC-loop use the default values and not the programmed ones (see below)

Operating Modes

Table 9

DC			
Const I	24	mA	Limit for Constant Current
Const V	38	V	Limit for Constant Voltage
Vdrop	28	V	Overall voltage drop
BoostGain	1.3		Additional gain in Boosted Battery Mode
RFS	375	Ω	Feeding Resistance (excluding the external Fuse resistors)
f _{Ring}	25	Hz	Ring Frequency
A _{Ring}	62	V _{rms}	Ring rms-value at Ring/Tip wire
DC Offset _{Ring}	22	V	Ring offset
f _{RingLP}	75	Hz	Corner Frequency of Ring-Lowpass
OffhookPD	2	mA	Power-Down Current for Offhook Detection
OffhookAct	8	mA	Offhook Detection in Active with 2 mA hysteresis
OffhookRing	5	mA	DC-Current for Offhook Detection in Ringing Mode
LineSup	5	mA	Current for Line-Supervision
Levelmeter1	8	mA	First levelmeter threshold
Levelmeter2	12	mA	Second levelmeter threshold
Levelmeter3	21	mA	Third levelmeter threshold
Levelmeter4	25	mA	Fourth levelmeter threshold
GKD1	17	mA	First threshold-current for Ground-Key-Detection
GKD2	40	mA	Second threshold-current for Ground-Key-Detection
RingTip	52	V	Threshold at Ring/Tip wire
DC-Lowpass	0.3/20	Hz	DC- Lowpass set to 0.3 and 20 Hz respectively
ConstRamp	300	V/s	Slope of the ramp while testing
delay _{Ring}	0	ms	Delay of Ring Burst
SRend1	1/128		Silent-Reversal threshold 1 (referred to the input of the rampgenerator)
SRend2	1/512		Silent-Reversal threshold 2 (referred to the input of the rampgenerator)
SRduration	ca. 80	ms	Duration of a Silent-Reversal-sequence
DUP	10	ms	Data Upstream Persistency Counter is set to 10 ms
DUPGNK	20	ms	Data Upstream Persistency Counter for GNK is set to 20 ms

- Boosted Battery is reset to normal feeding
- Reverse Polarity is reset to Normal Polarity
- All bits of the Signalling Register are masked and reset to 0 without the RES bit

Operating Modes

- The Data Upstream C/I channel bits are set to 0 except SLCX, it is set to 1 (the IO's are set to Input pins)
- Outputs are set tristate until the first SOP command
- C1 and C2 are set to PDNH
- A-Law is chosen

Table 10

AC			
IM-Filter	900	Ω	Approximately 900 Ω Real Input Impedance
TH-Filter	TH _{BRD}		Approximately BRD-Impedance for Balanced Network
AX	10	dB	Attenuation Transmit (this means about 0 dB)
AR	- 15.11	dB	Attenuation Receive (this means about - 7 dB)
ATTX	4	Vrms	Teletax Generator Amplitude at Ring / Tip wire at AHV-SLIC
f _{TTX}	16	kHz	Teletax Generator frequency;
TG1	1008	Hz	Tone Generator 1 and AC -levelmeter Bandpass (- 14 dBm0)
TG2	2000	Hz	Tone Generator 2 (+ 2 dB compared to TG1)

5.3 Power Down (PDown)

After a Reset (including the Power On Reset) or programming the CIDD-Byte the MuSLIC is set to Power Down State. In Power Down all functions which are not necessary are disabled to minimize power consumption. This can be done for all the channels or only for the not active ones. While the interface is fully working - including programmability of the registers with SOP or XOP commands and the Coefficient RAM (COP commands) - the rest of the MuSLIC is turned off except the supervision of the line. The change of the line state is reported via the HOOK-bit in the IOM-2 Data Upstream channel. To avoid spurious Offhook informations caused by longitudinal induction the HOOK-bit is low pass filtered (programmable with the DUPGNK-counter in PDown state only). The voice channel Data Downstream is directly fed into the voice channel Data Upstream. The HOOK-indication in PDown is optimized for longitudinal suppression up to 65 Vrms for the Offhook transition.

In Power Down Mode the AHV-SLIC can be set into two different modes:

1. PDNR, the resistive mode which provides a connection of 10 k Ω from TIP and RING to BGND and VBAT, respectively
2. PDNH, offers high impedance at TIP and RING

Operating Modes**5.4 Active Mode (Act)**

In Active Mode (“Conversation State”) both AC-and DC-Loop are fully working. The output voltage at the DC pins is controlled via the IT input pin in such way, that it behaves like a constant current source which turns automatically into a programmable resistive feeding source due to the DC-Characteristic values.

The ternary AHV-SLIC-interface is set to one of the active modes.

Polarity

The MuSLIC supports either normal or reverse Polarity which is set by the POLNR-bit (SCR0-7). A 180 degrees phase shift of the AC- and DC-Loop is done. The performance and the functionality is not influenced by that.

Boosted Battery

To feed subscriber lines with enhanced loop resistance the MuSLIC supports the Boosted Battery mode. The AHV-SLIC-Interface pins (C1, C2) are set to Boosted Battery (BB) mode and the maximum DC output voltage is extended to 140 V.

Meterpulses

The MuSLIC supports two different kinds of meterpulses: Meterpulses with 12/16 kHz (Teletax Metering) and with polarity reversal. The decision between these two types is made by the bit TTXNO (SCR1-7). If the bit TTXNO is set to 1 then the meterpulse is reversal. If the bit TTXNO is set to 0, Teletax Metering is used.

Metering with Polarity Reversal

As long as the M1 and the M2 bit of the C/I-channel (CIDD-4) is set to 1, the MuSLIC performs an immediate 180 degrees phase shift of the AC- and DC-Loop.

Teletax Metering Injection

For countries with Teletax Metering the MuSLIC provides either a 12 or a 16 kHz Signal (switchable with the bit TTX12 (SCR1-6))¹⁾ which amplitude is free programmable up to 10 Vrms at the Ring/Tip wire. The MuSLIC filters the Teletax pulses in transmit direction, too. The slope of the pulses are internally shaped so that the noise during switching and transmission is less than $50 \times 6.25 \mu\text{V}$ at AC pins and 1 mV at the IOM-2 interface (psophometrically weighted). With the bit NOSL (SCR1-5) the slope can be switched off. In that case the switching noise is not defined (for signalling only).

¹⁾ Note, that the right Teletax Coefficient Set (via COP-command) must be provided, too.

5.5 Ringing Mode

The MuSLIC generally supports balanced and unbalanced ringing. If the MuSLIC is set to Ringing Mode, the AC-loop is turned off and the DC-loop is automatically opened. The voice channel Data Downstream is directly fed into the voice channel Data Upstream.

Balanced Ringing

The sine wave of the ringing is generated in the MuSLIC. The frequency and the amplitude are free programmable between 16 and 70 Hz and up to 85 Vrms at the Ring/Tip wire, respectively. The DC offset voltage is programmable between 0 V and 30 V. If the Ring Burst On command is sent to the MuSLIC via the C/I-channel (M0 and M2 = 1) the begin (M2 = 1) and the end (M2 = 0) of the ring burst is automatically synchronized at the voltage zero crossing. If the DC-current at the IT-pin exceeds the programmed value, Offhook is detected within 2 periods of the ringing frequency and the Ring Burst is neglected. If Offhook is detected the MuSLIC changes automatically to the active mode.

Unbalanced Ringing

The ringing voltage is generated by an external ring generator. To connect this generator to the Ring/Tip wires relays are used. To control the relays the MuSLIC offers following functions:

If the REXTEN bit (XR2-7) is set to 1 the MIO1 is an input for the zero crossing signal. QIO1 is switched to the CIDD-4 (M2 bit) and offers the zero crossed ring burst on/off control signal.

5.6 Ground Start

Changing into the Ground Start mode by programming the CIDD Byte (M2 = 1, M1 and M0 = 0) the active mode is chosen and the Ternary SLIC-interface is set to high impedance of the Tip output (HIT: C1 = VOM, C2 = VOH).

5.7 Changing Modes

Offhook detection is low pass filtered with the time of 2 x DUP counter if any change of the modes or if one of the following crossovers occurs:

ring burst	<---->	ring pause
reverse	<---->	normal polarity
boosted	<---->	normal battery
ground start on	<---->	off
PDNR on	<---->	off
FIXC, LOAD, RESET on	<---->	off

Transmission Characteristics

6 Transmission Characteristics

The target figures in this specification are based on the subscriber-line board requirements. The proper adjustment of the programmable filters (transhybrid balancing, impedance matching, frequency-response correction) needs a complete knowledge of MuSLIC analog environment. Unless otherwise stated, the transmission characteristics are guaranteed within the test conditions.

Test Conditions

$T_A = 0$ to 70 °C;

$V_{DDI} = V_{DDA} = V_{DDB} = V_{DDC} = V_{DDD} = 5\text{ V} \pm 5\%$; $V_{SS} = -5\text{ V} \pm 5\%$;

$V_{DD} = 3.3\text{ V} \pm 5\%$

$GNDI = GNDA = GNDB = GNDC = GNDD = 0\text{ V}$

H_{IM} , H_{TH} , H_{FRX} , H_{FRR} , AR , AX will be defined to meet the 0 dBm0 specification.

$f = 1004\text{ Hz}$; 0 dBm0; A-Law;

A 0dBm0 AC signal in Transmit direction is equivalent to $2 \times 0.775\text{ Vrms}$ and in Receive direction equivalent to 0.775 Vrms (referred to $600\ \Omega$).

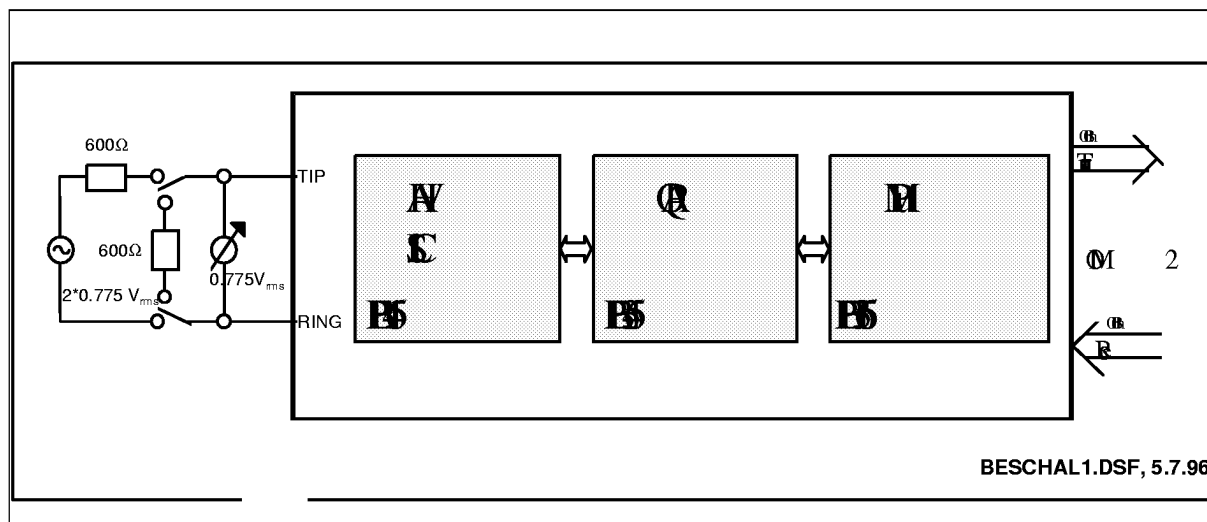

Figure 26

$$0\text{ dBm0}|_{\text{MuSLIC}} = 0\text{ dBm0}|_{600\ \Omega} = 0.775\text{ Vrms for receive direction.}$$

$$0\text{ dBm0}|_{\text{MuSLIC}} = 0\text{ dBm0}|_{600\ \Omega} = 2 \times 0.775\text{ Vrms for transmit direction.}$$

6.2 Frequency Response

Figure 27 Transmit: reference frequency 1 kHz, signal level - 10 dBm0, $H_{FRX} = 1$

Figure 28 Receive: reference frequency 1 kHz, signal level - 10 dBm0, $H_{FRR} = 1$

Transmission Characteristics

6.3 Gain Tracking (receive or transmit)

The gain deviations stay within the limits in the figures below.

measured with sine wave $f = 1004 \text{ Hz}$

reference level is -10 dBm0 .

Figure 29

Transmission Characteristics

6.4 Group Delay

Maximum delays when the PEB 3465 and the PEB 31665 are operating with $H_{TH} = H_{IM} = 0$ and $H_{FRR} = H_{FRX} = 1$ including delay through A/D- and D/A converters. Specific filter programming may cause additional group delays.

Group Delay deviations stay within the limits in the figures below.

Group Delay absolute values: Signal level – 10 dBm0

Table 11

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		
Transmit delay	D_{XA}	330		475	μs	$f = 1.5 \text{ kHz}$
Receive delay	D_{RA}	250		425	μs	$f = 1.5 \text{ kHz}$
Trans.-Receiver delay	D_{XRA}			900	μs	$f = 1.5 \text{ kHz}$

Figure 30 Group Delay Distortion receive and transmit:

Signal level – 10 dBm0, $f_{Test} @ T_{Gmin}$

Transmission Characteristics

6.5 Overload Compression

Figure 31 Transmit: measured with sine wave $f = 1004$ Hz

Transmission Characteristics

6.6 Total Distortion

The signal to distortion ratio exceeds the limits in the following figure:

Receive: measured with sine wave $f = 1004$ Hz. (C-message weighted for μ -law, psychoacoustically weighted for A-law). The mean relative level is -7 dB.

Figure 32

AR = 7 dB

Table 12

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		
Signal to distortion at full attenuation	$SD_{att R}$		- 13		dB	Signal S = - 40 dB AR = + 30 dB

Transmission Characteristics

Transmit: measured with sine wave $f = 1004$ Hz. (C-message weighted for μ -law, psychoacoustically weighted for A-law). The mean relative level is 0 dBr.

Figure 33

AX = 0 dBr

Table 13

Parameter	Symbol	Limit Values			Unit	Test Condition
		mi.n	typ.	max.		
Signal to distortion at full gain	$SD_{att T}$		- 17		dB	Signal S = - 40 dB AX = - 30 dB

Transmission Characteristics

6.7 Out-of-Band Signals at Analog Output (receive)

With a 0 dBm0 sine wave with frequency f (300 Hz to 3.4 kHz) applied to the digital input, the level of any resulting out-of-band signal at the analog output will stay at least X dB below a 0 dBm0, 1 kHz sine wave reference signal at the analog output.

Figure 34

Transmission Characteristics

Out-of-Band Signals at Analog Input (transmit)

With a 0 dBm0 out-of-band sine wave signal with frequency f (< 100 Hz or 3.4 kHz to 100 kHz) applied to the analog input, the level of any resulting frequency component at the digital output will stay at least X dB below a 0 dBm0, 1 kHz sine wave reference signal at the analog input. ¹⁾

Figure 35

¹⁾ Poles at $12 \text{ kHz} \pm 150 \text{ Hz}$ respectively $16 \text{ kHz} \pm 150 \text{ Hz}$ and harmonics will be provided

Transmission Characteristics

6.8 Transhybrid Loss

The quality of Transhybrid-Balancing is very sensitive to deviations in gain and group delay – deviations inherent to the MuSLIC A/D- and D/A-converters as well as to all external components used on a line card.

Measurement of MuSLIC Transhybrid-Loss: A 0dBm0 sine wave signal with a frequency in the range between 300 – 3400 Hz is applied to the digital input. The resulting analog output signal at the differential outputs ACP and ACN is connected to the pin ITAC. The programmable filters FRR, AR, FRX, AX and IM are disabled, the balancing filter TH is enabled with coefficients optimized for this configuration (ACP–ACN = ITAC).

The resulting echo measured at the digital output is at least X dB below the level of the digital input signal as shown in the table below.

Table 14

	COP-write	Coefficients
TH-Filter Part 1	t.b.d.	t.b.d.
TH-Filter Part 2	t.b.d.	t.b.d.
TH-Filter Part 3	t.b.d.	t.b.d.

Table 15

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	typ.		
Transhybrid Loss at 500 Hz	THL ₅₀₀		50	dB	
Transhybrid Loss at 2500 Hz	THL ₂₅₀₀		44	dB	
Transhybrid Loss at 3000 Hz	THL ₃₀₀₀		42	dB	

Electrical Characteristics

All digital input voltages referred to GNDI = 0 V; (VDDI = 5 V)		- 0.3	5.3	V	
referred to VDDI = 5 V; (GNDI = 0 V)		- 5.3	0.3	V	
DC input and output current at any input or output pin (free from latch-up)			100	mA	
Storage temperature	T_{STG}	- 65	125	°C	
Ambient temperature under bias	T_A	- 10	80	°C	
Power dissipation	P_D		1	W	

Note: Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device.

Functional operation under these conditions is not implied.

Exposure to conditions beyond those indicated in the recommended operational conditions of this specification may effect device reliability.

Electrical Characteristics

7.1.2 Operating Range

$T_A = 0$ to 70 °C; all V_{DD} 's = 5 V \pm 5%; $V_{SS} = -5$ V \pm 5%; all GND's = 0 V

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		
V_{DD} supply current ¹⁾						
Power down	$I_{DD_{PDown}}$		24		mA	all channels PDown
Active	$I_{DD_{Act}}$		67		mA	all channels active
V_{SS} supply current ¹⁾						
Power down	$I_{SS_{PDown}}$		0		mA	all channels PDown
Active	$I_{SS_{Act}}$		5		mA	all channels active
Power supply rejection-ratio	PSRR					ripple: 1 kHz, 100 mVrms
Receive VDD						t.b.d.
Receive VSS						t.b.d.
Transmit VDD		40			dB	at IOM-2
Transmit VSS		40			dB	at IOM-2
Power dissipation ¹⁾						
Power down	P_{PDown}		120		mW	all channels PDown
Active	P_{act1}		180		mW	1 channel active
Active	P_{act}		360		mW	all channels active

¹⁾ Power dissipation and supply currents are target values

Note: In the operating range the functions given in the circuit description are fulfilled.

Electrical Characteristics

7.1.3 I/O-Pins

$T_A = 0$ to 70 °C; all V_{DD} 's = $5\text{ V} \pm 5\%$; $V_{SS} = -5\text{ V} \pm 5\%$; all GND's = 0 V

Parameter	Symbol	Limit Values		Unit	Test Condition
		min	max.		
For all input pins:					
Low-input pos.-going	V_{T+}	- 0.3	3.15	V	see figure 36
Low-input neg.-going	V_{T-}	1.35	$V_{DD} + 0.3$	V	see figure 36
Low-input Hysteresis	V_H	0.5		V	$V_H = V_{T+} - V_{T-}$
Input leakage current	I_{IL}	- 1	1	μA	$- 0.3 \leq V_{in} \leq V_{DD}$
Spike rejection for RESET	t_{rej}	50	200	ns	
For I/O1 and O1:					
Low-output voltage	V_{OL}		0.5	V	$I_O = - 50\text{ mA}$
High-output voltage	V_{OH}	3.5		V	$I_O = 2\text{ mA}$
For I/O2:					
Low-output voltage	V_{OL}		0.5	V	$I_O = - 2\text{ mA}$
High-output voltage	V_{OH}	3.5		V	$I_O = 2\text{ mA}$

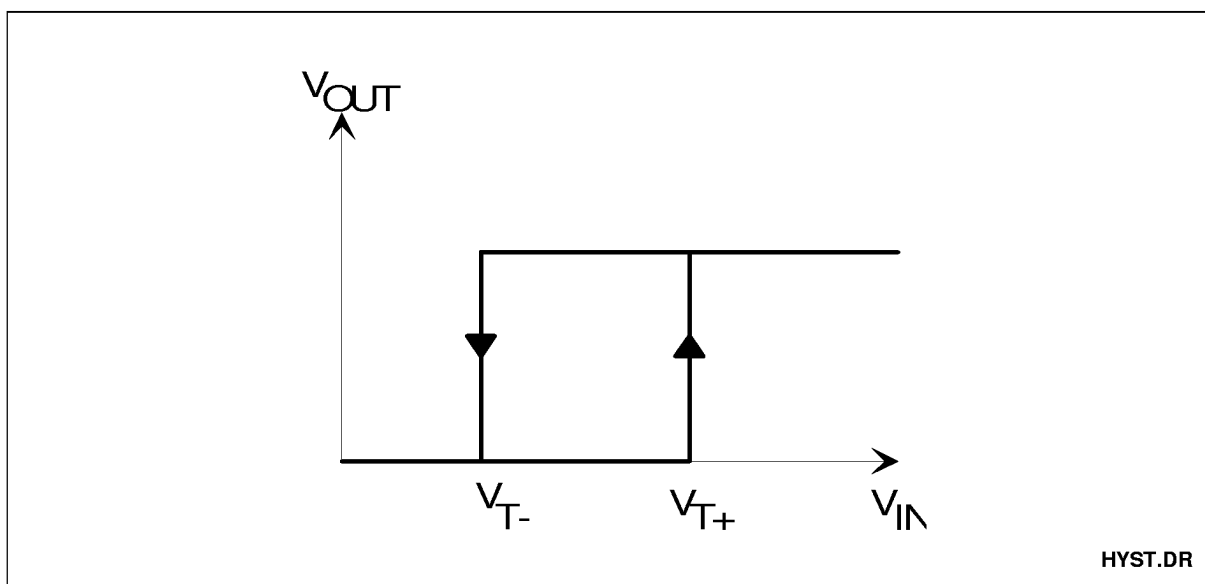

Figure 36

Electrical Characteristics

7.1.4 DC-Feeding

$T_A = 0$ to 70 °C; all V_{DD} 's = $5\text{ V} \pm 5\%$; $V_{SS} = -5\text{ V} \pm 5\%$; all GND's = 0 V

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		
"Line Current" Measurement: Transmit	$V_{IT\ offset}$	- 25		25	mV	direct/reverse polarity ¹⁾
	$V_{IT\ gain}$	0.95		1.05		$f < 50\text{ Hz}$, direct/reverse polarity
	$V_{IT\ THD}$	40	50		dB	direct/reverse polarity
"Line Voltage" Feeding: Receive	$V_{DC\ offset}$	- 25		25	mV	normal battery, $f = 300\text{ Hz}$
	$V_{DC\ gain}$	0.94		1.06		normal battery, $f = 300\text{ Hz}$
Receive Boosted	$V_{DC\ THD}$	40	50		dB	normal battery
	$V_{DC\ offset}$	- 40		40	mV	boosted battery, $f = 300\text{ Hz}$
	$V_{DC\ gain}$	1.5	1.6	1.7		boosted battery, $f = 300\text{ Hz}$
	$V_{DC\ THD}$	40	50		dB	boosted battery

¹⁾ Reverse polarity is an internal state of the PEB 31665; the polarity of the voltage at PIN IT is positive.

Electrical Characteristics

7.1.5 AHV-SLIC Interface and Supervision Functions

$T_A = 0$ to 70 °C; all V_{DD} 's = $5\text{ V} \pm 5\%$; $V_{SS} = -5\text{ V} \pm 5\%$; all GND's = 0 V

Parameter	Symbol	Limit Values			Unit	Test Condition/ Result
		min.	typ.	max.		
Longitudinal Current Input (IL)	$V_{IL\ gain}$	0.9	1	1.1		$f < 50\text{ Hz}$ $V_{in} = -2.4 \dots +2.4\text{ V}$
Auxiliary Inputs (VA, VB, VBIM)	$V_{x\ gain}$	0.9	1	1.1		$f < 50\text{ Hz};$ $V_{in} = -2.4 \dots +2.4\text{ V}$
Output voltage: AHV-SLIC-Interface C1, C2						
High level	V_{OHHV}		$0.8 \times VDD$		V	$I_{out} < 10\ \mu\text{A}$
Mid level	V_{OMHV}		$0.51 \times VDD$		V	$I_{out} < 10\ \mu\text{A}$
Low level	V_{OLHV}		$0.22 \times VDD$		V	$I_{out} < 10\ \mu\text{A}$
Current drained from pin C1 in all 3 states	I_{OTLo}			80	μA	TEMPA = 0 ¹⁾
	I_{OTHi}	120			μA	TEMPA = 1

¹⁾ TEMPA is reported via the MuPP/QAP-Interface to the PEB 31665

Electrical Characteristics

7.2 PEB 31665 (MuPP)

7.2.1 Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit	Remarks
		min.	max.		
V_{DD} referred to GND		- 0.3	3.6	V

Electrical Characteristics

7.3.3 Electrical Parameters

Min / max values are valid within the full operating range. If PEB- and PEF-specifications are different, both values can be found in the respective column.

Testing is performed according to the test figures with external circuitry as depicted in fig. t.b.d. Unless otherwise stated, load impedance $R_L = 600 \Omega$, $V_{BAT} = -70 V$ and $V_H = +60 V$, $V_{DD} = +5 V$, $V_{SS} = -5 V$. Test temperatures are 25 °C and 70 °C for PEB, -40 °C, 25 °C and 85 °C for PEF-type (without heatsink).

Supply Currents and Power Dissipation ($I_R = I_{TIP} = 0 A$; $V_{RT} = 0 V$) ¹⁾

10.1 IOM[®]-2 Interface Monitor Transfer Protocol

Monitor Channel Operation

The monitor channel is used for the transfer of maintenance information between two functional blocks. Using two monitor control bits (MR and MX) per direction, the data are transferred in a complete handshake procedure. The MR and MX bits in the fourth octet (C/I channel) of the IOM-2 frame are used for the handshake procedure of the monitor channel

The monitor channel transmission operates on a pseudo-asynchronous basis:

- Data transfer (bits) on the bus is synchronized to Frame Sync FSC
- Data flow (bytes) are asynchronously controlled by the handshake procedure.

For example: Data is placed onto the DD-Monitor-Channel by the Monitor-transmitter of the master device (DD-MX-Bit is activated i.e. set to '0'). This data transfer will be repeated within each frame (125 μs rate) until it is acknowledged by the MuPP Monitor-receiver by setting the DU-MR-bit to '0', which is checked by the Monitor-transmitter of the master device. Thus, the data rate is not 8-kbytes/s.

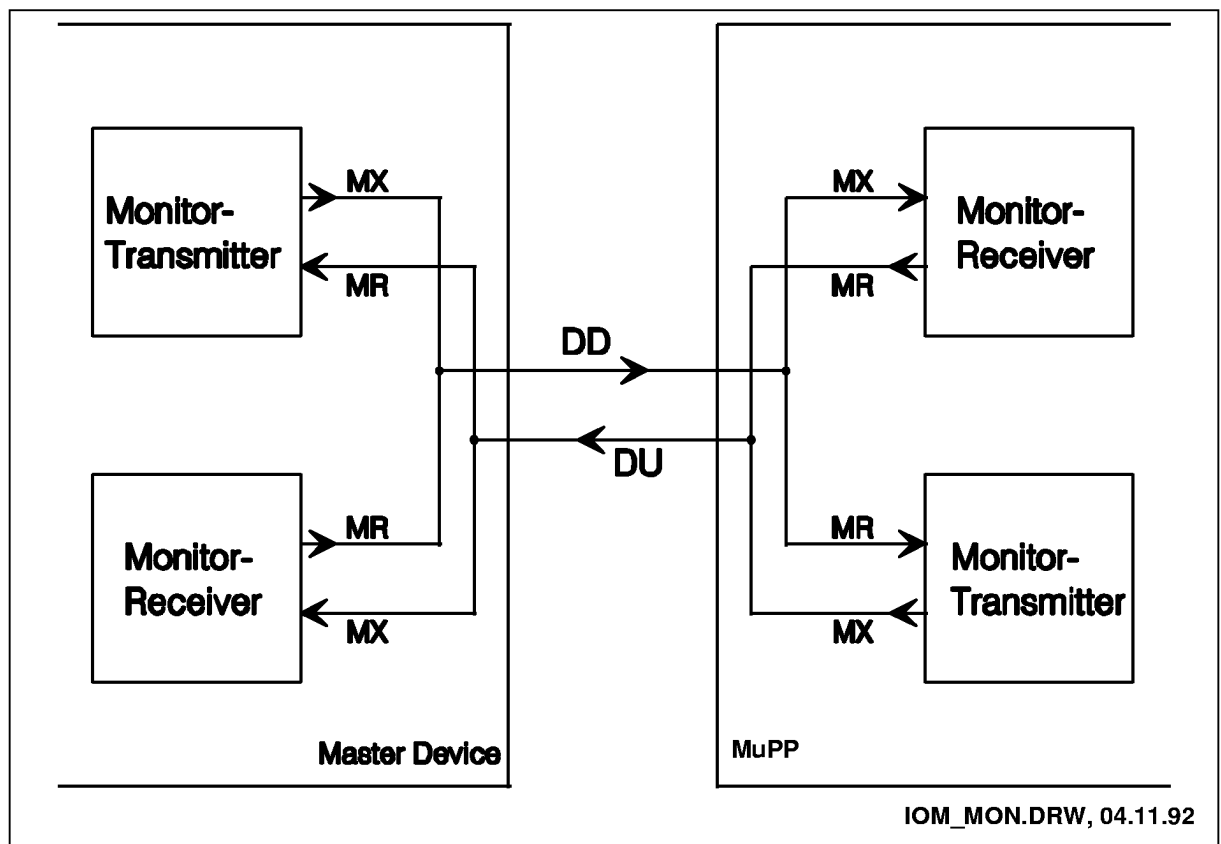

Figure 42

Monitor handshake procedure

The monitor channel works in 3 states

- idle state: A pair of inactive (set to '1') MR- and MX-bits during two or more consecutive frames: End of Message (EOM)
- sending state: MX-bit is activated (set to '0') by the Monitor-transmitter, together with data-bytes (can be changed) on the Monitor-channel
- acknowledging: MR-bit is set to active (set to '0') by the Monitor-receiver, together with a data-byte remaining in the Monitor-channel.

A start of transmission is initiated by a Monitor-transmitter in sending out an active MX-bit together with the first byte of data (the address of the receiver) to be transmitted in the Monitor-channel.

This state remains until the addressed Monitor-Receiver acknowledges the received data by sending out an active MR-bit, which means that the data-transmission is repeated each 125 μ s frame (minimum is one repetition). During this time the Monitor-transmitter evaluates the MR-bit.

Flow control, means in the form of transmission delay, can only take place when the transmitters MX and the receivers MR bit are in active state.

Since the receiver is able to receive the monitor data at least twice (in two consecutive frames), it is able to check for data errors. If two different bytes are received the receiver will wait for the receipt of two identical successive bytes (last look function).

A collision resolution mechanism (check if another device is trying to send data during the same time) is implemented in the transmitter. This is done by looking for the inactive ('1') phase of the MX-bit and making a per bit collision check on the transmitted monitor data (check if transmitted '1's are on DU/DD-line; DU/DD-line are open-drain lines).

Any abort leads to a reset of the MuPP command stack, the device is ready to receive new commands.

To obtain a maximum speed data transfer, the transmitter anticipates the falling edge of the receivers acknowledgment.

Due to the inherent programming structure, duplex operation is not possible. It is not **allowed** to send any data to the MuPP, while transmission is active.

Figure 43 State Diagram of the MuPP Monitor Transmitter

- MR ... MR - bit Received on DD - line
- MX ... MX - bit Calculated and expected on DU - line
- MXR ... MX - bit Sampled on DU - line
- CLS ... Collision within the monitor data byte on DU - line
- RQT ... Request for transmission from internal source
- ABT ... Abort request/indication

Figure 44 State Diagram of the MuPP Monitor Receiver

MR ... MR - bit Calculated and transmitted on DU - line
 MX ... MX - bit Received data downstream (DD - line)
 LL ... Last lock of monitor byte received on DD - line
 ABT ... Abort indication to internal source

Monitor Channel Data Structure

The monitor channel is used for the transfer of maintenance information between two functional blocks. By use of two monitor control bits (MR and MX) per direction, the data are transferred in a complete handshake procedure.

Address Byte

Messages to and from the MuPP are started with the following byte:

Bit	7	6	5	4	3	2	1	0
	1	0	0	0	0	0	0	1

Thus providing information for up to 16 analog lines, the MuPP is one device for up to 16 IOM-2 time slots. Monitor data for the analog channels is selected by the MuPP specific commands (SOP, XOP, TOP or COP) following.

10.2 Channel Identification Command (CIC)

In order to unambiguously identify different devices by software, a two Byte identification command is defined for analog lines IOM-2 devices. A device requesting the identification of the MuPP will send the following 2 byte code:

1	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Each device will then respond with its specific identification code. For the MuPP this two byte identification code is:

1	0	0	0	CONF			
1	0	0	0	0	0	0	1

CONF an optional 4-bit code indicating the specific hardware environment. A typical application of the CONF code is the differentiation of various types of line circuits that use the same MuSLIC hardware within the same system.

For the realization of the Channel Identification Commands on the line card, it needs 4 pins of the MuPP (ID0,...ID3). One pin (ID0) is switchable as a digital serial interface of a shift register, to transfer special line card design informations up to 2 × 15 bytes into the monitor channel of the IOM-2 interface.

Appendix

There are two different solutions of the CIC for the MuPP to identify the version of the line card.

Solution 1: ('Normal' Channel Identification Command)

The input of the 4 pin interface (ID0 ... ID3) is transferred to the 4 bit CONF information using the following truth-table (binary coded):

Table 21

MuPP Ports				CONF-inf.
ID3	ID2	ID1	ID0	(4 bits)
0 V	0 V	0 V	0 V	0 0 0 0
0 V	0 V	0 V	3 V	0 0 0 1
0 V	0 V	3 V	0 V	0 0 1 0
0 V	0 V	3 V	3 V	0 0 1 1
0 V	3 V	0 V	0 V	0 1 0 0
0 V	3 V	0 V	3 V	0 1 0 1
0 V	3 V	3 V	0 V	0 1 1 0
0 V	3 V	3 V	3 V	0 1 1 1
3 V	0 V	0 V	0 V	1 0 0 0
3 V	0 V	0 V	3 V	1 0 0 1
3 V	0 V	3 V	0 V	1 0 1 0
3 V	0 V	3 V	3 V	1 0 1 1
3 V	3 V	0 V	0 V	1 1 0 0
3 V	3 V	0 V	3 V	1 1 0 1
3 V	3 V	3 V	0 V	1 1 1 0
3 V	3 V	3 V	3 V	1 1 1 1

This is a 14 possible individual line card design information or an address pointer for the system to get more basic information.

The information is read through the IOM-2 monitor channel with the CIC command.

Solution 2 (Extended Channel Identification Command):

The second realization step is that the combination of ports (ID1, ID2, ID3 = + 3 V) changes the input port ID0 to a shift register input.

Table 22

MuPP Ports				CONF-inf.
ID3	ID2	ID1	ID0	(4 bits)
+ 3 V	+ 3 V	+ 3 V	x	1 1 1 x

An external shift register on the line card transmits up to 2 × 15 bytes of special HW + FW line card design information.

The information is read through the IOM-2 monitor channel with the XOP Command for XR7 or XR8. The CONF code is '111x' by this extended identification.

The first schematic gives an overview of the different timings for the extended channel identification.

Figure 45 General Timing

Expected Output of the ASIC Which Sends the Channel Identification:

The MuPP sends the Extended Channel Identification in the Monitor Channel of that time slot in which the XOP Command was sent. If – for example – the MuPP uses the time slot 6, the Monitor Channel of TS6 looks like the following (for all other time slots equivalent).

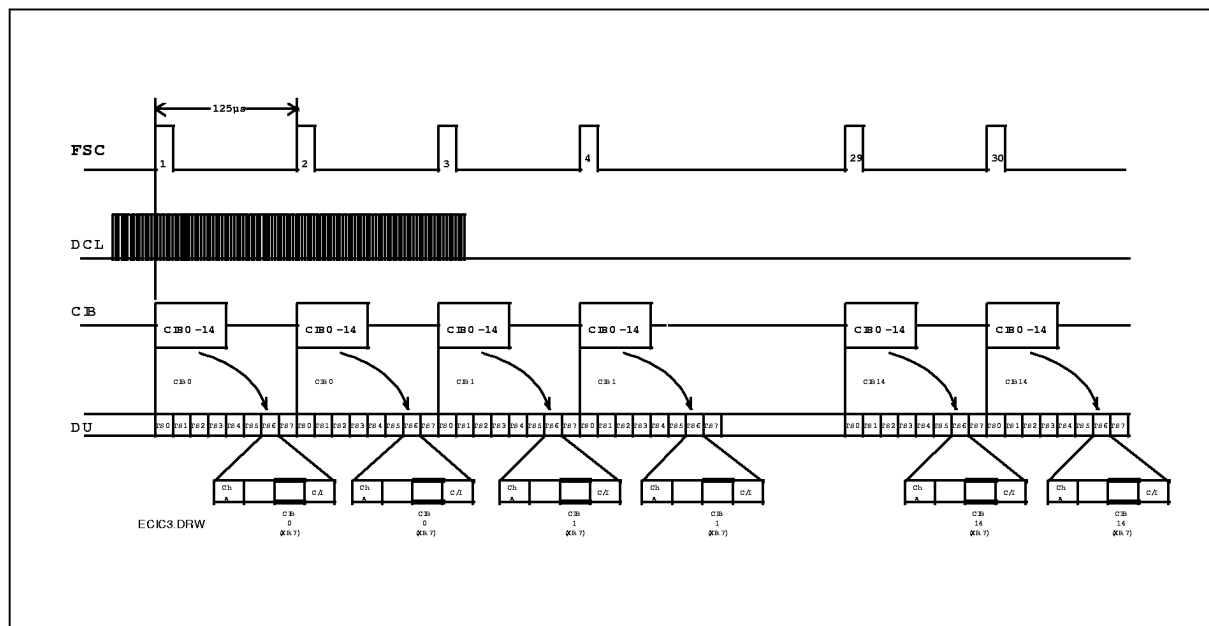

Figure 46

Expected Input Timing and IOM-2 Interface Timing and Switching characteristic: To be defined

10.3 List of Abbreviations

ACT	Active Mode
ADC	Analog Digital Converter
AGDCR	Attenuation DC Receive
AGDCX	Attenuation DC Transmit
AGR	Attenuation Receive
AGX	Attenuation Transmit
AGTTX	Attenuation Teletax
AR	Attenuation Receive
ASIC	Application Specific Integrated Circuit
AX	Attenuation Transmit
BB	Boosted Battery
