## 100MHz Current Feedback Amplifier

The HA-5004 current feedback amplifier is a video/wideband amplifier optimized for low gain applications. The design is based on current-mode feedback which allows the amplifier to achieve higher closed loop bandwidth than voltage-mode feedback operational amplifiers. Since feedback is employed, the HA-5004 can offer better gain accuracy and lower distortion than open loop buffers. Unlike conventional op amps, the bandwidth and rise time of the HA-5004 are nearly independent of closed loop gain. The 100 MHz bandwidth at unity gain reduces to only 65 MHz at a gain of 10. The HA-5004 may be used in place of a conventional op amp with a significant improvement in speed power product.

Several features have been designed in for added value. A thermal overload feature protects the part against excessive junction temperature by shutting down the output. If this feature is not needed, it can be inhibited via a TTL input (TOI). A TTL chip enable/disable ( $\overline{\mathrm{OE})}$ is also provided; when the chip is disabled its output is high impedance. Finally, an open collector output flag ( $\overline{\mathrm{TOL}}$ ) is provided to indicate the status of the chip. The status flag goes low to indicate when the chip is disabled due to either the internal Thermal Overload shutdown or the external disable.

In order to maximize bandwidth and output drive capacity, internal current limiting is not provided. However, current limiting may be applied via the $\mathrm{V}_{\mathrm{C}^{+}}$and $\mathrm{V}_{\mathrm{C}}$ - pins which provide power separately to the output stage.

For Military grade product refer to the HA-5004/883 data sheet.

## Pinout

## Features

- Slew Rate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1200V/ $\mu \mathrm{s}$
- Output Current . . . . . . . . . . . . . . . . . . . . . . . . . . . $\pm 100 \mathrm{~mA}$
- Drives . . . . . . . . . . . . . . . . . . . . . . . . . . . . $\pm 9$ V into $100 \Omega$
- VSUPPLY. . . . . . . . . . . . . . . . . . . . . . . . . . . . $\pm 5 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$
- Thermal Overload Protection and Output Flag
- Bandwidth Nearly Independent of Gain
- Output Enable/Disable

## Applications

- Unity Gain Video/Wideband Buffer
- Video Gain Block
- High Speed Peak Detector
- Fiber Optic Transmitters
- Zero Insertion Loss Transmission Line Drivers
- Current to Voltage Converter
- Radar Systems

## Operating Conditions

Temperature Range
HA-5004-5
$0^{\circ} \mathrm{C}$ to $75^{\circ} \mathrm{C}$
CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
NOTES:

1. Maximum power dissipation, including load condition, must be designed to maintain the junction temperature below $175^{\circ} \mathrm{C}$. See Thermal Resistances in the "Thermal Information" section.
2. $\theta_{J A}$ is measured with the component mounted on an evaluation PC board in free air.

## Application Information

## Theory Of Operation

The HA-5004 is a high performance amplifier that uses current feedback to achieve its outstanding performance. Although it is externally configured like an ordinary op amp in most applications, its internal operation is significantly different.

Inside the HA-5004, there is a unity gain buffer from the noninverting ( + ) input to the inverting-input (as suggested by the circuit symbol), and the inverting terminal is a low impedance point. Error currents are sensed at the inverting input and amplified; a small change in input current produces a large change in output voltage. The ratio of output voltage delta due to input current delta is the transimpedance of the device.

Steady state current at the inverting input is very small because the transimpedance is large. The voltage across the input terminals is nearly zero due to the buffer amplifier. These two properties are similar to standard op amps and likewise simplify circuit analysis.

## Resistor Selection

The HA-5004 is optimized for a feedback resistor of $250 \Omega$, regardless of gain configuration. It is important to note that this resistor is required even for unity gain applications; higher gain settings use a second resistor like regular op amp circuits as shown in Figure 2 below.

FIGURE 2. TYPICAL APPLICATION CIRCUIT, $A_{v}=+2$

## Power Supplies

The HA-5004 will operate over a wide range of supply voltages with excellent performance. Supplies may be either single-ended or split, ranging from $6 \mathrm{~V}( \pm 3 \mathrm{~V})$ to $36 \mathrm{~V}( \pm 18 \mathrm{~V})$. Appropriate reduction in input and output signal excursion is necessary for operation at lower supply voltages. Bypass
capacitors from each supply to ground are recommended, typically a $0.01 \mu \mathrm{~F}$ ceramic in parallel with a $4.7 \mu \mathrm{~F}$ electrolytic.

## Current Limit

No internal current limiting is provided for the HA-5004 in order to maximize bandwidth and slew rate. However, power is supplied separately to the output stage via pins $1\left(\mathrm{~V}_{\mathrm{C}^{+}}\right)$ and $14\left(\mathrm{~V}_{\mathrm{C}}\right)$ so that external current limiting resistors may be used. If required, $100 \Omega$ resistors to each supply rail are recommended.

## Enable/Disable and Thermal Overload Operation

The HA-5004 operates normally with a TTL low state on pin 7 ( $\overline{\mathrm{OE}})$ but it may be disabled manually by a TTL high state at this input. When disabled, the output and inverting-input go to a high impedance state and the circuit is electrically debiased, reducing supply current by about 5 mA . It is important to keep the differential input voltage below the absolute maximum rating of 5 V when the device is disabled.

If the power dissipation becomes excessive and chip temperature exceeds approximately $180^{\circ} \mathrm{C}$, the HA-5004 will automatically disable itself. The thermal overload condition will be indicated by a low state at the TOL output on pin 10. (TOL is also low for manual shutdown via pin 7). Automatic thermal shutdown can be bypassed by a TTL high state on Thermal Overload Inhibit (TOI) pin 6. See the truth table for a summary of operation.

## Offset Adjustment

Offset voltage may be nulled with a $5 \mathrm{k} \Omega$ potentiometer between pins 3 and 4, center tapped to the positive supply. Setting the slider towards pin 3 (+BAL) increases output voltage; towards pin 4 (-BAL) decreases output voltage. Offset can be adjusted by about $\pm 10 \mathrm{mV}$ with a 5 K pot; this range is extended with a lower resistance potentiometer.
