

LMV712

Low Power, Low Noise, High Output, RRIO Dual Operational Amplifier with Independent Shutdown

General Description

The LMV712 duals are high performance BiCMOS operational amplifiers intended for applications requiring Rail-to-Rail inputs combined with speed and low noise. They offer a bandwidth of 5MHz and a slew rate of 5 V/ μ s and can handle capacitive loads of up to 200pF without oscillation.

The LMV712 is guaranteed to operate from 2.7V to 5.5V and offers two independent shutdown pins. This feature allows disabling of each device separately and reduces the supply current to less than 1 μ A typical. The output voltage rapidly ramps up smoothly with no glitch as the amplifier comes out of the shutdown mode.

The LMV712 with the shutdown feature is offered in space saving 10-Bump micro SMD and 10-Pin Leadless Leadframe Package (LLP) packages. It is also offered in 10-Pin MSOP package. These packages are designed to meet the demands of small size, low power, and low cost required by cellular phones and similar battery operated portable electronics.

Features

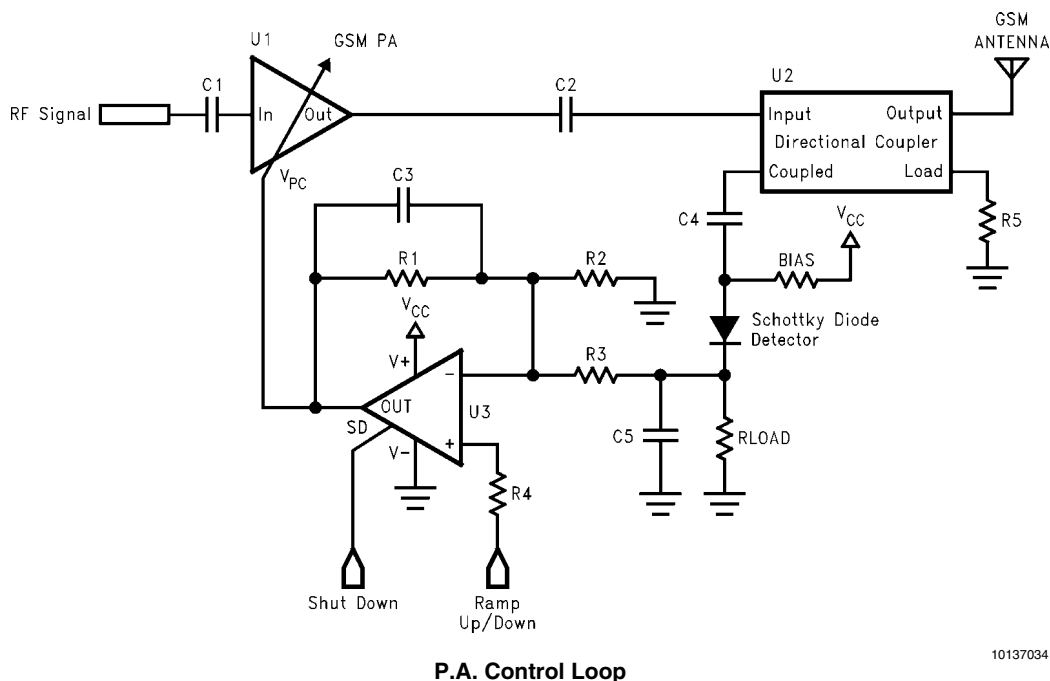

(Typical Unless Otherwise Noted)

- 5MHz GBP
- Slew rate 5V/ μ s
- Low noise 20nV/ \sqrt Hz
- Supply current 1.22mA/channel
- $V_{OS} < 3mV$ max.
- Guaranteed 2.7V and 5V specifications
- Rail-to-Rail inputs and outputs.
- Unity gain stable.
- Small package: 10-Pin LLP, 10-Pin MSOP and 10-Bump micro SMD
- 1.5 μ A shutdown I_{CC}
- 2.2 μ s turn on

Applications

- Power amplifier control loop
- Cellular phones
- Portable equipment
- Wireless LAN
- Radio systems
- Cordless phones

Typical Application Circuit

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

ESD Tolerance (Note 2)	
Human Body Model	1.5kV
Machine Model	150V
Differential Input Voltage	±Supply Voltage
Voltage at Input/Output Pin	(V+) +0.4V to (V-) -0.4V
Supply Voltage (V+ - V-)	6V
Output Short Circuit V+	(Note 3)
Output Short Circuit V-	(Note 3)
Current at Input Pin	±10mA
Current at Output Pin	±50mA

Storage Temp Range	-65°C to 150°C
Mounting Temperature	
Infrared or Convection (20 sec)	235°C
Junction Temperature T _{JMAX} (Note 4)	150°C

Recommended Operating Conditions (Note 1)

Supply Voltage	2.7V to 5.5V
Temperature Range	-40°C ≤ T _J ≤ 85°C
Thermal Resistance	
10-Pin MSOP	235°C/W
10-Pin LLP	53.4°C/W
10-Bump micro SMD	196°C/W

2.7V Electrical Characteristics Unless otherwise specified, all limits guaranteed for V+ = 2.7V, V- = 0V, V_{CM} = 1.35V and T_A = 25°C and R_L > 1MΩ. **Boldface** limits apply at the temperature extremes.

	Turn-On Time for Shutdown	micro SMD	6 8			μ s

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

Note 2: Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC). Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

Note 3: Shorting circuit output to either V^+ or V^- will adversely affect reliability.

Note 4: The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / \theta_{JA}$. All numbers apply for packages soldered directly onto a PC Board.

Note 5: Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

Note 6: All limits are guaranteed by testing or statistical analysis.

Note 7: Number specified is the slower of the positive and negative slew rates.

Typical Performance Characteristics

Unless otherwise specified, $V_S = +5V$, single supply, $T_A = 25^\circ C$.

Application Information

THEORY OF OPERATION

The LMV712 dual op amp is derived from the LMV711 single op amp. *Figure 1* contains a simplified schematic of one channel of the LMV712.

10137031

FIGURE 1.

Rail-to-Rail input is achieved by using in parallel, one NMOS differential pair (MN1 and MN2) and one PMOS differential pair (MP1 and MP2). When the common mode input voltage (V_{CM}) is near V^+ , the NMOS pair is on and the PMOS pair is off. When V_{CM} is near V^- , the NMOS pair is off and the PMOS pair is on. When V_{CM} is between V^+ and V^- , internal logic decides how much current each differential pair will get. This special logic ensures stable and low distortion amplifier operation within the entire common mode voltage range.

Because both input stages have their own offset voltage (V_{OS}) characteristic, the offset voltage of the LMV712 becomes a function of V_{CM} . V_{OS} has a crossover point at 1.4V above V^- . Refer to the " V_{OS} vs. V_{CM} " curve in the Typical Performance Characteristics section. Caution should be taken in situations where input signal amplitude is comparable to V_{OS} value and/or the design requires high accuracy. In these situations, it is necessary for the input signal to avoid the crossover point.

The current coming out of the input differential pairs gets mirrored through two folded cascode stages (Q1, Q2, Q3, Q4) into the "class AB control" block. This circuitry generates voltage gain, defines the op amp's dominant pole and limits the maximum current flowing at the output stage. MN3 introduces a voltage level shift and acts as a high impedance to low impedance buffer.

The output stage is composed of a PMOS and a NPN transistor in a common source/emitter configuration, delivering a rail-to-rail output excursion.

The MN4 transistor ensures that the LMV712 output remains near V^- when the amplifier is in shutdown mode.

SHUTDOWN PIN

The LMV712 offers independent shutdown pins for the dual amplifiers. When the shutdown pin is tied low, the respective amplifier shuts down and the supply current is reduced to less than $1\mu\text{A}$. In shutdown mode, the amplifier's output level stays at V^- . In a 2.7V operation, when a voltage between 1.5V to 2.7V is applied to the shutdown pin, the amplifier is enabled. As the amplifier is coming out of the shutdown mode, the output waveform ramps up without any glitch. This is demonstrated in *Figure 2*.

FIGURE 2.

A glitch-free output waveform is highly desirable in many applications, one of which is power amplifier control loops. In this application, the LMV712 is used to drive the power amplifier's power control. If the LMV712 did not have a smooth output ramp during turn on, it would directly cause the power amplifier to produce a glitch at its output. This adversely affects the performance of the system.

To enable the amplifier, the shutdown pin must be pulled high. It should not be left floating in the event that any leakage current may inadvertently turn off the amplifier.

PRINTED CIRCUIT BOARD CONSIDERATION

To properly bypass the power supply, several locations on a printed circuit board need to be considered. A 6.8µF or greater tantalum capacitor should be placed at the point where the power supply for the amplifier is introduced onto the board. Another 0.1µF ceramic capacitor should be placed as close as possible to the power supply pin of the amplifier. If the amplifier is operated in a single power supply, only the V⁺ pin needs to be bypassed with a 0.1µF capacitor. If the amplifier is operated in a dual power supply, both V⁺ and V⁻ pins need to be bypassed.

It is good practice to use a ground plane on a printed circuit board to provide all components with a low inductive ground connection.

Surface mount components in 0805 size or smaller are recommended in the LMV712 application circuits. Designers can take advantage of the micro SMD, MSOP and LLP miniature sizes to condense board layout in order to save space and reduce stray capacitance.

CAPACITIVE LOAD TOLERANCE

The LMV712 can directly drive 200pF in unity-gain without oscillation. The unity-gain follower is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers. The combination of the amplifier's output impedance and the capacitive load induces phase lag. This results in either an under-damped pulse re-

sponse or oscillation. To drive a heavier capacitive load, Figure 3 can be used.

FIGURE 3.

In Figure 3, the isolation resistor R_{ISO} and the load capacitor C_L form a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of R_{ISO}. The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. But the DC accuracy is degraded when the R_{ISO} gets bigger. If there were a load resistor in Figure 3, the output voltage would be divided by R_{ISO} and the load resistor.

The circuit in Figure 4 is an improvement to the one in Figure 3 because it provides DC accuracy as well as AC stability. In this circuit, R_F provides the DC accuracy by using feed-forward techniques to connect V_{IN} to R_L. C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop. Increased capacitive drive is possible by increasing the value of C_F. This in turn will slow down the pulse response.

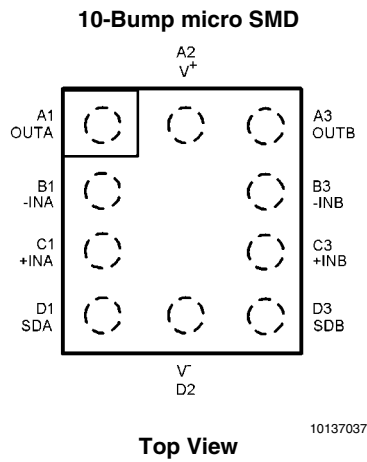

FIGURE 4.

LATCHUP

CMOS devices tend to be susceptible to latchup due to their internal parasitic SCR (silicon controlled rectifier) effects. The input and output pins look similar to the gate of the SCR. There is a minimum current required to trigger the SCR gate lead. The LMV712 is designed to withstand 150mA surge current on all the pins. Some resistive method should be used to isolate any capacitance from supplying excess current to the pins. In addition, like an SCR, there is a minimum holding current for any latchup mode. Limiting current to the supply pins will also inhibit latchup susceptibility.
