

## LMC6009 9 Channel Buffer Amplifier for TFT-LCD

### General Description

The LMC6009 is a CMOS integrated circuit that buffers 9 reference voltages for gamma correction in a Thin Film Transistor Liquid Crystal Display (TFT-LCD). Guaranteed to operate at both 3.3V and 5V supplies, this integrated circuit contains nine, independent unity gain buffers that can source 130 mA into a capacitive load without oscillation.

The LMC6009 is useful for buffering gamma voltages into column drivers that employ the resistor-divider architecture. High output current capability and fast settling characteristics of this device improve display quality by minimizing rise time errors at the outputs of the column driver. The integration of nine buffers and a multiplexer eliminates the need for discrete buffers and a separate multiplexer (MUX) chip on the panel.

The LMC6009 is available in 48-pin surface mount TSSOP.

### Features

- Number of inputs 18
- 3.3V and 5V operation
- Supply current 3.5 mA
- Settling time 3 μs
- A/B channel inputs for asymmetrical Gamma
- Number of outputs 9
- Number of control inputs 1
- Built-in thermal shutdown protection

### Applications

- VGA/SVGA TFT-LCD drive circuits
- Electronic Notebooks
- Electronic Games
- Personal Communication Devices
- Personal Digital Assistants (PDA)

### Application in VGA/SVGA TFT-LCD

## Applications

The LMC6009 is useful for buffering the nine reference voltages for gamma correction in a TFT-LCD as shown in *Figure 7*. The A/B channel inputs allow the user to alternate two sets of gamma references to compensate for asymmetrical Gamma characteristic during Row Inversion. The LMC6009 eliminates the need for nine external switches or an 18-to-9 multiplexer.

Since the buffers in the LMC6009 draw extremely low bias current (1.5  $\mu\text{A}$  max), large resistance values can be used in the reference voltage string. This allows the power dissipation in the gamma reference circuit to be minimized. The nine buffers are guaranteed to deliver 80 mA to the load, allowing the pixel voltages of the TFT-LCD to settle very quickly.

## Applications (Continued)

FIGURE 7.

**Example:** Below is a calculation of pixel charge time (for a black to black transition) in a VGA display operating at a vertical refresh rate of 60 Hz, with a panel capacitance of 50 pF per sub-pixel:

A full black to black transition represents the maximum charging time for the panel, since it requires that the panel capacitance be driven by a 4V swing from node  $V_{REF1}$  (Figure 7).

Total capacitive load presented to the LMC6009 is

$$C_L = 50 \text{ pF} \times 3 \times 640 = 96 \text{ nF}$$

Output current of the LMC6009 is:

$$I_{SC} = 80 \text{ mA}$$

$$\text{Hence, slew time } t_{SLEW} = (96 \text{ nF} \times 4V)/80 \text{ mA} = 3.07 \mu\text{s}$$

The total line time for a VGA system is approximately 34  $\mu\text{s}$ .

Therefore, the LMC6009 easily meets the drive requirements for the application. The input resistance seen between the  $V_{REFn}$  and  $V_{REF(n+1)}$  inputs, (where  $n = 0$  thru 8) of the

Column Driver (Figure 7) also draw current from the LMC6009. Thus, the actual current available for charging the panel capacitance is:

$$I_{px} = 80 \text{ mA} - (V_{VREF1} - V_{VREF2})/R_{CD}$$

where

$V_{VREFn}$  = Voltage at node  $V_{REFn}$ ,

$V_{VREF(n+1)}$  = Voltage at node  $V_{REF(n+1)}$ , and

$R_{CD}$  = Column driver input resistance between  $VREFn$  and  $VREF(n+1)$

Since the LMC6009 is capable of sourcing 80 mA, the pixel charging time is primarily limited only by the length of the  $R_{CD} \cdot C_L$  time constant. To implement a high quality display, column drivers that allow the shortest possible time constant (lower values of  $R_{CD}$ ) are desirable. However, lower values of  $R_{CD}$  result in increased system quiescent power dissipation. It is therefore important to optimize system performance by carefully considering speed vs power tradeoffs.
