# Charge Pump for Backlight/Flash/RGB LEDs with Safety Timer 

#### Abstract

General Description The MAX8879 provides complete light management for main display backlight, subdisplay backlight (or RGB indicator), and white LED camera flash with regulated constant current up to 610 mA total. By utilizing adaptive $1 x / 1.5 x / 2 x$ charge-pump modes and very-lowdropout current regulators, it achieves high efficiency over the full 1-cell Li+ battery input voltage range. The 1 MHz fixed-frequency switching allows for tiny external components while the regulation scheme is optimized to ensure low EMI and low input ripple. An integrated derating function protects the LEDs from overheating during high ambient temperatures. The MAX8879 features an internally trimmed reference to set the maximum LED current. An $I^{2} \mathrm{C}$ serial port is used for on/off control and setting the LED currents in 32 linear steps for main, sub/RGB, and movie. When using the RGB indicator, the $I^{2} \mathrm{C}$ port provides 32 k colors and programmable ramp-up/down rates. The camera flash for flash-mode operation is enabled by an active-low signal on the $\overline{\mathrm{FSH}}$ pin. A safety timer is activated on the falling edge of $\overline{\mathrm{FSH}}$, which has an $\mathrm{I}^{2} \mathrm{C}$ adjustable (programmable) period of no timer, 0.5 s , 1.0 s , or 2.0 s (default). If the safety timer period expires, both flash and movie modes are disabled.

## Applications

Cell Phones and Smartphones
PDAs, Digital Cameras, Camcorders
Displays with Up to 11 LEDs

Features

- Guaranteed 610mA Continuous Drive Capability 4 LEDs at 30mA Each for Main Display 3 LEDs at 30mA Each for Sub or RGB 400mA Total for Flash
- 2-Wire I²C Serial Port

5-Bit (32-Step) Linear Dimming 32k Colors
Ramp-Up/Down Rates

- 92\% Peak/83\% Avg Efficiency (Pled/Pbatt)
- Adaptive 1x/1.5x/2x Mode Switchover
- 0.3\% (typ) LED Current Accuracy and Matching
- Low Input Ripple and EMI
- Low 0.1 1 A Shutdown Current
- Output Overvoltage Protection
- $I^{2} \mathrm{C}$ Programmable Flash Safety Timer
- Thermal Derating Function Protects LEDs
- 24-Pin, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ Thin QFN Package

Ordering Information

| PART | TEMP RANGE | PIN- <br> PACKAGE |
| :---: | :---: | :--- |
| MAX8879ETG + | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 24 Thin QFN <br> $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ |

Pin Configuration appears at end of data sheet.
+Denotes a lead-free/RoHS-compliant package.

Typical Operating Circuit

## ABSOLUTE MAXIMUM RATINGS

|  |
| :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: All devices are $100 \%$ production tested at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$. Limits over the operating temperature range are guaranteed by design.

Note 2: LED current specification includes both accuracy and matching tolerance.
Note 3: Dropout voltage is defined as the M2 or F3 to GND voltage at which current into M2 or F3 drops $10 \%$ from the value at 0.2 V . All other current regulators are tested functionally by the accuracy test and guaranteed for low dropout by design.

Pin Description

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 1 | PIN | Power-Supply Voltage Input. Connect PIN to IN. Connect a $4.7 \mu \mathrm{~F}$ ceramic capacitor from PIN to PGND. The input voltage range is 2.7 V to 5.5 V . PIN is high impedance during shutdown. |
| 2 | IN | Analog Supply Voltage Input. Connect IN to PIN. The input voltage range is 2.7 V to 5.5 V . IN is high impedance during shutdown. |
| 3 | GND | Ground. Connect GND to system ground and the ground side of the input bypass capacitor as close to the IC as possible. |
| 4 | VDD | Logic-Input Supply Voltage. Connect VDD to the logic supply driving SDA and SCK. Connect a $0.1 \mu \mathrm{~F}$ ceramic capacitor from VDD to GND. |
| 5 | M4 |  |
| 6 | M3 | LED Cathode Connections. Current flowing into these pins is based on the internal ${ }^{2} \mathrm{C}$ dimming |
| 7 | M2 | registers. The charge pump regulates the lowest LED cathode voltage to 0.15 V . Grounding any of |
| 8 | M1 | approximately 5 V . To avoid constantly operating in overvoltage protection mode, any unused LED |
| 9 | F4 | cathode connection ( $\mathrm{M}_{-}$, $\mathrm{S}_{-}$, or $\mathrm{F}_{-}$) must be connected to OUT. This disables the corresponding |
| 10 | F3 | current regulator. These pins are high |
| 11 | F2 | M1 through M4 are for main display |
| 12 | F1 | S1 through S3 are for subdisplay backlights or one RGB LED indicator. |
| 13 | S3 |  |
| 14 | S2 | Any combination of $\mathrm{M}_{-}, \mathrm{S}_{-}$, and $\mathrm{F}_{-}$can be connected together to drive higher current LEDs. |
| 15 | S1 |  |
| 16 | $\overline{\text { FSH }}$ | Flash Logic Input. Drive $\overline{\mathrm{FSH}}$ low to turn on the flash LEDs (F1-F4) at the current specified in the internal flash register. The built-in flash timer is activated by synchronizing with the active-low falling edge on the pin. Drive $\overline{\text { FSH }}$ high to turn off the flash LEDs. This logic-high/low signal is only dedicated for enabling or deactivating flash LEDs. If the embedded flash timer expires in a certain time, it is not reactivated unless a falling edge is monitored again. |
| 17 | SCK | $1^{2} \mathrm{C}$ Clock Input. Data is read on the rising edge of SCK. |
| 18 | SDA | $1^{2} \mathrm{C}$ Data Input. Data is read on the rising edge of SCK. |
| 19 | C1N | Transfer Capacitor 1 Negative Connection. Connect a $1 \mu$ F ceramic capacitor from C1N to C1P. C1N is shorted to IN during shutdown. |
| 20 | C1P | Transfer Capacitor 1 Positive Connection. Connect a $1 \mu$ F ceramic capacitor from C1N to C1P. During shutdown, if VOUT > VIN, C1P is shorted to OUT. If VOUT < VIN, C1P is shorted to IN. |
| 21 | PGND | Power Ground. Charge-pump switching ground. Connect to GND and EP as close to the IC as possible. |
| 22 | OUT | Output. Connect a $10 \mu \mathrm{~F}$ ceramic capacitor from OUT to PGND. The anodes of all the LEDs connect to OUT. OUT is pulled to ground through an internal $5 \mathrm{k} \Omega$ resistor in shutdown. |
| 23 | C2P | Transfer Capacitor 2 Positive Connection. Connect a $1 \mu$ F ceramic capacitor from C2N to C2P. During shutdown, if VOUT > VIN, C2P is shorted to OUT. If VOUT < VIN, C2P is shorted to IN. |
| 24 | C2N | Transfer Capacitor 2 Negative Connection. Connect a $1 \mu$ F ceramic capacitor from C2N to C2P. C2N is shorted to IN during shutdown. |
| - | EP | Exposed Paddle. Connect to GND and PGND directly under the IC. |

## Charge Pump for Backlight/Flash/RGB LEDs with Safety Timer

Figure 1. Functional Diagram

# Charge Pump for Backlight/Flash/RGB LEDs with Safety Timer 

## Detailed Description

The MAX8879 charge pump operates in three modes to maintain high efficiency over a wide supply voltage range. The IC automatically selects between these three modes as described in the $1 x / 1.5 x / 2 x$ Mode Switchover section.
Current-sinking LED cathode connections are provided to drive four main (M_) and three sub (S_) LEDs at a regulated current up to 30 mA each. The sub LED connections can be used for either subdisplay backlighting or one RGB indicator. The IC also contains four flash LED connections ( $F_{-}$) that sink up to 100 mA each. These LED connections can be connected together in any combination to provide increased current up to 610 mA total.
An $I^{2} \mathrm{C}$ serial port is used for on/off control and setting the LED currents in 32 linear steps. When using the RGB indicator, the $1^{2} \mathrm{C}$ port provides 32 k colors and programmable ramp-up/down rates. The camera flash may be turned on/off through a separate digital logic input ( $\overline{\mathrm{FSH}}$ ) with the maximum flash safety timer programmed to an $I^{2} \mathrm{C}$-selectable value. The movie mode may be turned on/off only though the $I^{2} \mathrm{C}$ interface. The flash and movie modes have separately adjustable brightness levels through separate $\mathrm{I}^{2} \mathrm{C}$ registers.

## 1x/1.5x/2x Mode Switchover

When the input voltage is higher than the required output voltage needed to drive the LEDs, the MAX8879 pulls OUT up to the input voltage (in $1 \times$ mode), while still regulating the LED current with the current regulators. As the input voltage drops, the lowest LED cathode voltage falls below the 100 mV switchover
threshold, and the MAX8879 starts switching in 1.5x mode. When the input voltage is rising, the transition from $1.5 x$ to $1 x$ is made when $V_{I N}$ is greater than VOUT. When the MAX8879 is running in 1.5 x mode and the input voltage is decreased, the lowest LED cathode voltage crosses the 100 mV switchover threshold again. At this point, the MAX8879 changes to the $2 x$ chargepump mode. With the input voltage rising and the MAX8879 in $2 x$ mode, the IC changes to $1.5 x$ mode once V IN is greater than $2 / 3$ of the output voltage.

## Soft-Start

The MAX8879 includes soft-start circuitry to limit inrush current at turn-on and mode transitions. When starting up, the output capacitor is charged directly from the input with a ramped current source (with no chargepump action) until the output voltage is near the input voltage. After $512 \mu \mathrm{~s}$, if all the LED cathodes are not above 100 mV , the MAX8879 switches to 1.5 x mode with the LED output current ramped from $1 / 32$ to the programmed current in $1 / 32$ steps. After another $512 \mu \mathrm{~s}$, if all the LED cathodes are not above 100 mV , the MAX8879 switches to $2 x$ mode, once again ramping the LED current from $1 / 32$ to the programmed current in $1 / 32$ steps. Any time the output voltage is less than 1.25 V , the soft-start routine is reset to the $1 \times$ state. Thus, the startup time is $512 \mu \mathrm{~s}, 1024 \mu \mathrm{~s}$, or $1536 \mu \mathrm{~s}$, depending on what mode is required after the completion of startup.

## Output-Current Settings

The output currents for the main, sub, and flash current regulators are set using the $I^{2} \mathrm{C}$ serial interface (see the ${ }^{12} \mathrm{C}$ Interface section). The current for the four main LEDs is always equal and set with a single command.

## Charge Pump for Backlight/Flash/RGB LEDs with Safety Timer

Table 4. RGB Ramp Rate

| CONTROL BYTE <br> (HEXADECIMAL) | RGB RAMP <br> RATE (A/s) | RAMP TIME FROM OFF TO <br> FULL BRIGHTNESS (ms) |
| :---: | :---: | :---: |
| E0 | 58.6 | 0.512 |
| E1 | 0.114 | 262 |
| E2 | $\mathbf{0 . 0 5 7 2}$ | $\mathbf{5 2 4}$ |
| E3 | 0.0286 | 1048 |

*Default in bold italics.
The currents for the three sub LEDs are set independently, allowing them to drive an RGB LED. The cur-rent-level settings for both the main and sub LEDs range from 0.9 mA to 30 mA , defaulting to 15 mA each (see Tables 1, 2, and 3).
The flash LEDs are controlled by pulsing the $\overline{\text { FSH }}$ input low. There are two registers in the MAX8879 to set the flash/movie current level. The Movie register sets the F1-F4 LED current when the $I^{2} \mathrm{C}$ interface is used to activate the LEDs and the Flash register sets the F1-F4 LED current when the FSH input is pulsed low. The current level settings for the flash LEDs ranges from 3.3 mA to 100 mA , with a default of 25.8 mA (see Tables 1,2 , and 3). The Flash register has priority over the Movie register when both movie and flash are on. In the event that the flash safety timer period expires, the flash LEDs are turned off and the movie mode ON/OFF control bit is reset to 0 . This is to prevent the MAX8879 from going back into movie mode in the event of a safety timer violation.

The LED cathode connections (M_, $\mathrm{S}_{-}$, and $\mathrm{F}_{-}$) can be connected together in any combination to allow the use of higher current LEDs. For example, to drive a single flash LED at up to 400 mA , connect F1, F2, F3, and F4 together to the cathode of the flash LED.
To avoid constantly operating in overvoltage protection mode, any unused LED cathode connection (M_, S_, or $F_{\text {_) }}$ must be connected to OUT. This disables the corresponding current regulator.

RGB Color and Ramp-Rate Settings
The three sub LED currents are controlled independently by the ${ }^{2} \mathrm{C}$ interface, allowing for use of a common anode RGB LED. Thirty-two programmable brightness levels (5 bits) per LED provide a total of 32k colors. To smooth the transition between different color/brightness settings, a controlled ramp is used when the sub LED current level is changed, when the sub LEDs are enabled, and when the LEDs are disabled. The ramp rate is set to one of four settings with the $\mathrm{I}^{2} \mathrm{C}$ interface (see Table 4).

## Temperature-Derating Function

The MAX8879 contains a temperature-derating function that automatically limits the LED current at high temperatures in accordance with the recommended derating curve of popular white LEDs. The derating function enables the safe usage of higher LED current at room temperature, thus reducing the number of LEDs required to backlight the display. In camera-light applications, the derating circuit protects the LEDs and PC board from overheating. The derating circuit limits the LED current

Figure 2. $1^{2} \mathrm{C}$ Timing Diagram

# Charge Pump for Backlight/Flash/RGB LEDs with Safety Timer 

by reducing the LED current above $+40^{\circ} \mathrm{C}$ by approximately $1.7 \% /{ }^{\circ} \mathrm{C}$. The typical derating function characteristic is shown in the Typical Operating Characteristics. The temperature derating function is enabled/disabled using the ${ }^{2} \mathrm{C}$ interface and is off by default.

I2C Interface
An $I^{2} \mathrm{C} 2$-wire serial interface is provided on the MAX8879 to control LED brightness, flash, temperature deration, and RGB ramp rate. The serial interface consists of a serial data line (SDA) and a serial clock line (SCK). Standard $I^{2} \mathrm{C}$ write-byte commands are used. Figure 2 shows a timing diagram for the $1^{2} \mathrm{C}$ protocol. The MAX8879 is a slave-only device, relying upon a master to generate a clock signal. The master (typically a microprocessor) initiates data transfer on the bus and generates SCK to permit data transfer. A master device communicates to the MAX8879 by transmitting the proper 8 -bit address ( $0 \times 9$ A) followed by the 8 -bit control byte. Each 8 -bit control byte consists of a 3-bit command code and 5 bits of data (see Table 1). Each transmit sequence is framed by a START (A) condition and a STOP (L) condition (see Figure 2). Each word transmitted over the bus is 8 bits long and is always followed by an acknowledge clock pulse.

## Shutdown Mode

When all the LEDs are off, the MAX8879 turns off the charge pump and enters low-power shutdown mode. When in shutdown, OUT is pulled to GND by an internal $5 \mathrm{k} \Omega$ resistor, discharging the output capacitor. IN and PIN are high impedance during shutdown, but the $I^{2} \mathrm{C}$ interface (powered from VDD) remains active. To enter shutdown, send control byte $0 \times 00$ to the $I^{2} \mathrm{C}$ interface, and drive STB high. To exit shutdown, enable any of the LEDs with the $\mathrm{I}^{2} \mathrm{C}$ interface.
$\overline{\text { FSH Logic Input }}$
The $\overline{\text { FSH }}$ input is used to control the flash LEDs with the embedded safety timer. When $\overline{\text { FSH }}$ is driven low, the flash LEDs are driven to the current set in the Flash register. Driving FSH low activates the flash safety timer with the pre-set time (programmed period). The safety timer is not activated until an active-low signal is applied to FSH. This function also serves as a protection feature to avoid thermal damage to the flash LEDs because of software-related errors. This pin is the flashdedicated control pin.

## Movie-Mode Operation

The movie current level is set through the $1^{2} \mathrm{C}$ interface according to the current scale in Movie register. The ON/OFF of movie LEDs is only through $1^{2} \mathrm{C}$ interface.

#### Abstract

Output Overvoltage Protection In case an LED fails or the cathode is shorted to GND, the output overvoltage protection limits the output to 5 V . When the MAX8879 detects the output voltage rising above 5 V , it shuts off the charge pump. The charge pump restarts once the output voltage has dropped to 4.9 V .

To avoid constantly operating in overvoltage protection, any unused LED cathode connection (M_, S_, or $\mathrm{F}_{-}$) must be connected to OUT; this disables the corresponding current regulator.

Thermal Shutdown Thermal shutdown limits total power dissipation in the MAX8879. When the junction temperature exceeds $+160^{\circ} \mathrm{C}$, the MAX8879 turns off, allowing the IC to cool. The MAX8879 turns on and begins soft-start after the junction temperature cools by $20^{\circ} \mathrm{C}$. This results in a pulsed output during continuous thermal-overload conditions.

## Applications Information

## Input Ripple

In $1 \times$ mode, the input ripple of the MAX8879 is negligible. When the charge pump is switching in 1.5 x or 2 x mode, the input ripple depends on the load current and the output impedance of the source supply. The worstcase ripple occurs when the charge pump is operating in $1.5 x$ mode. The switching waveforms in the Typical Operating Characteristics show the typical input ripple. For noise-sensitive applications, input ripple can be reduced by increasing the input capacitance.

## Capacitor Selection

Ceramic capacitors are recommended due to their small size, low cost, and low ESR. Select ceramic capacitors that maintain their capacitance over temperature and DC bias. Capacitors with X5R or X7R temperature characteristics generally perform well. Recommended values are shown in the Typical Operating Circuit. Using a largervalue input capacitor helps to reduce input ripple (see the Input Ripple section).

## PCB Layout and Routing

The MAX8879 is a high-frequency switched-capacitor regulator. For best circuit performance, use a solid ground plane and place the capacitors as close to the IC as possible. Connect the exposed pad to GND and PGND, and allow sufficient copper area for cooling the IC. Refer to the MAX8879 evaluation kit for an example PCB layout.
