

## 74ABT3284 18-Bit Synchronous Datapath Multiplexer

### General Description

The 74ABT3284 is a synchronous datapath buffer designed to transmit four 9-bit bytes of data onto one or two 9-bit bytes in 2:1 or 4:1 multiplexed configurations. In addition, the non-inverting transceiver supports bidirectional data transfer in transparent or registered modes. A data byte from any one of the six ports can be stored during transparent operation for later recall. Data input to any port may also be read back to itself for byte manipulation or system self-diagnostic purposes.

The 74ABT3284 is useful for interleaving data in memory applications or for use in bus-to-bus communications where variations in data word length or construction are required.

- 18-bit 2:1 or 9-bit 4:1 multiplexed modes
- Registered or transparent datapath operation
- Output enables and select lines have the option of being synchronized for pipelined operation
- Independent input, output register and control synchronizing clocks insure maximum timing flexibility
- Independent control signals insure functional flexibility
- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down cycle
- Non-destructive hot insertion capability

### Features

- Advanced BiCMOS technology provides high speed at low power consumption

Commercial	Package Number	Package Description
74ABT3284VJG	VJG100A	100-Lead (14mm x 14mm) Molded Plastic Quad Flatpak, JEDEC

TRI-STATE® is a registered trademark of National Semiconductor Corporation.

## Functional Description

The 74ABT3284 is a bi-directional registered data-path routing device which can multiplex/de-multiplex four 9-bit "A-side" data ports (Ports A, B, C, D) onto/from one 9-bit "X-side" port (Port X). Alternatively, it can be configured for mux/demux of two 18-bit data paths (Ports A and C, B and D) onto/from one 18-bit data path (Ports X and Y).

Each of the six 9-bit I/O ports have independent active low TRI-STATE® output enable control logic which can be configured to operate asynchronously or synchronously. With MODE\_\_SO low, direct asynchronous output control is provided. With MODE\_\_SO high, output enable control is asserted synchronously on the positive edge of the CP\_\_IN clock. All I/O port inputs are continuously active allowing output state feedback.

The four A-side ports (A, B, C, D) contain independently enabled input and output data registers for storage of data passing in either direction. The input register (AIR, BIR, CIR, DIR) is loaded/held on the positive edge of CP\_\_AX when the respective Load Control pin (LDAI, LDBI, LDCI, LDDI) is asserted high/low. The Input Registers can be loaded with data from the corresponding A-side port. The output register (AOR, BOR, COR, DOR) is loaded/held on the positive edge of CP\_\_XA when the respective Load Control pin (LDAO, LDBO, LDCO, LDDO) is asserted high/low. The Output Registers can be loaded with data from Port X when MODE\_\_WS is asserted low. When MODE\_\_WS is asserted high, the Output Registers A and C can be loaded with Port X data and the B and D Output Registers can be loaded with data from Port Y.

When routing data from A-side to X-side, Data Path Control is provided for the following options via the SA2X inputs; Transparent mode where Input Register is bypassed but can simultaneously monitor A-side data; Registered Mode where X-side receives data from the selected Input Registers; Readback Mode where X-side receives data from the selected Output Registers. A-side data from Ports A, B, C, or D can be selected to Port X via the XSEL data path select inputs. Ports B or D can be selected to Port Y via the YSEL data path select input.

When routing data from X-side to A-side, Data Path Control is provided for the following options via the ASEL inputs; Transparent mode where Output Register is bypassed but can simultaneously monitor X-side data; Registered Mode where the A-side Port receives data from the corresponding Output Register; Readback Mode where the A-side Port receives data from the corresponding Input Registers. MODE\_\_WS asserted low selects Port X data to be passed to Ports A, B, C, and D. With MODE\_\_WS asserted high, Port X data is passed to Ports A and C with Port Y data passed to Ports B and D.

All Data Path Control Inputs and Input/Output Register Load Enable Inputs are active high and can be asserted asynchronously or synchronously. When MODE\_\_SC is low, these inputs operate asynchronously. When MODE\_\_SC is high, the inputs are asserted synchronously on the positive edge of the CP\_\_IN clock.

When operating the Data Path Control and/or the Output Enable Input groups with MODE\_\_SC and/or MODE\_\_SO "hard wired" high for synchronous mode, a single pre-clock of CP\_\_IN will be required following power-up to insure that all internal synchronous control registers are in the appropriate known state. If the application requires "on the fly" changes from asynchronous to synchronous operation, then the respective control/enable pin data must be pre-clocked via CP\_\_IN and held steady prior to and during any low to high transition of the MODE\_\_SO or MODE\_\_SC to properly initiate the sync control registers for synchronous control mode.

## Pin Descriptions

Pin Name	Description	Operation
$\overline{OEa}$	Output Enable Inputs (Active Low)	Sync/Async
LDaI	Load Enable Inputs for the Input Registers	Sync/Async
LDaO	Load Enable Inputs for the Output Registers	Sync/Async
ASEL(0,1)	A-Side Data Path Select Inputs	Sync/Async
SA2X(0,1)	X-Side Data Path Select Inputs	Sync/Async
XSEL(0,1)	X-Port Data Path Select Inputs	Sync/Async
YSEL	Y-Port Data Path Select Input	Sync/Async
MODE__W	Word Mode Select Input for the X/Y to A-Side Direction	Sync/Async
MODE__SO	Enable Input for Synchronous Output Enable Control	Async
MODE__SC	Enable Input for Synchronous Data Path Control	Async
CP__IN	Clock Input for Synchronous Control (Positive Edge Trigger)	
CP__AX	Clock Input for Input Registers (Positive Edge Trigger)	
CP__XA	Clock Input for Output Registers (Positive Edge Trigger)	

## Function Tables

Output Enable Control Table

Inputs			Outputs	Control Mode	Function
$\overline{OE}$ (A, B, C, D, X, Y)	MODE__SO	CP__IN	Port A, B, C, D, X, Y		
L	L	X	ENABLE	ASYNC	ENABLED OUTPUT, I/O input always active
H	L	X	DISABLE	ASYNC	DISABLED OUTPUT, I/O input always active
(Notes 2, 3)	H (Note 1)		(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SO must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs  $\overline{OE}$  (A, B, C, D, X, Y) steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:**  $\overline{OE}$  (A, B, C, D, X, Y) levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SO is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

A Side Data Path Select Function Table

Inputs				Data Path		Control Mode	Function
ASEL(1)	ASEL(0)	MODE__SC	CP__IN	From Reg/Port	To Port		
L	L	L	X	(A, B, C, D) IR	A, B, C, D	ASYNC	Readback; Contents of Input Register (A, B, C, D) IR to Port (A, B, C, D)
L	H	L	X	(A, B, C, D) OR	A, B, C, D	ASYNC	Clocked Path; Contents of Output Register (A, B, C, D) OR to Port (A, B, C, D)
H	L	L	X	Port X	A, B, C, & D	ASYNC	Transparent Path; Port X to Port A, B, C, & D
H	H	L	X	Port X Port Y	A & C B & D	ASYNC	Transparent Path; Port X to Port A & C Transparent Path; Port Y to Port B & D
(Notes 2, 3)	(Notes 2, 3)	H (Note 1)		(Note 3)	(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SC must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs ASEL(0) and ASEL(1) steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** ASEL(0) and ASEL(1) levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

Input Register Control Table

Inputs					Register	Control Mode	Function
Port (A, B, C, D)	LD(A, B, C, D) I	MODE__SC	CP__IN	CP__XA	(A, B, C, D) IR		
X	L	L	X		HOLD	ASYNC	HOLD; Input Register holds previous state.
L (H)	H	L	X		L (H)	ASYNC	LOAD; Port A, B, C, D clocked to Input Register (A, B, C, D) IR via CP__AX positive edge
(Note 3)	(Notes 2, 3)	H (Note 1)		(Note 3)	(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SO must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs LDAI, LDBI, LDCI, and LDDI steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** LDAI, LDBI, LDCI and LDDI levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

### Output Register Control Table

Inputs							Output Register		Control Mode	Function
Port X	Port Y	LD(A, B, C, D) O	MODE_W	MODE_SC	CP_IN	CP_XA	(A, C) OR	(B, D) OR		
X	X	L	X	L	X		HOLD	HOLD	ASYNCR	HOLD OR
L (H)	X	H	L	L	X		L (H)	L (H)	ASYNCR	LOAD OR Port X to OR (A, B, C, D)
L (H)	L (H)	H	H	L	X		L (H)	L (H)	ASYNCR	LOAD OR Port X to OR (A, C) Port Y to OR (B, D)
(Note 3)	(Note 3)	(Notes 2, 3)	(Notes 2, 3)	H (Note 1)		(Note 3)	(Note 3)	(Note 3)	SYNCR	(Note 3)

**Note 1:** Low to High transitions of MODE\_SC must be immediately preceded by a low to high transition (clock edge) on CP\_IN while holding Synchronous Control Inputs LDAO, LDBO, LDCO, LDDO and MODE\_W steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** LDAO, LDBO, LDCO, LDDO and MODE\_W levels are synchronously asserted by the positive transition of CP\_IN when MODE\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_IN.

## Function Tables (Continued)

### 1st Level X Side Data Path Select Function Table

Inputs				Data Path		Control Mode	Function
SA2X(1)	SA2X(0)	MODE__SC	CP__IN	From Reg/Port	To Internal Node		
L	L	L	X	A, B, C, D	(A, B, C, D) X	ASYNC	Transparent datapath from Port (A, B, C, D) to internal node (A, B, C, D) X
L	H	L	X	(A, B, C, D) IR	(A, B, C, D) X	ASYNC	Clocked Path; Contents of Input Register (A, B, C, D) IR to internal node (A, B, C, D) X
H	L	L	X	(A, B, C, D) OR	(A, B, C, D) X	ASYNC	Readback; contents of Output register (A, B, C, D) OR to internal node (A, B, C, D) X
H	H	L	X	GND	(A, B, C, D) X	ASYNC	Diagnostic; Select all 36 bits as low and pass to the internal node (A, B, C, D) X
(Notes 2, 3)	(Notes 2, 3)	H (Note 1)	⎓	(Note 3)	(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SC must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs SA2X(0) and SA2X(1) steady to preset internal sync registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** SA2X(0) and SA2X(1) levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

### 2nd Level X Side Data Path Select Function Table for Port X

Inputs				Data Path		Control Mode	Function
XSEL(1)	XSEL(0)	MODE__SC	CP__IN	From Internal Node	To Port		
L	L	L	X	AX	X	ASYNC	Internal Node AX to Port X
L	H	L	X	BX	X	ASYNC	Internal Node BX to Port X
H	L	L	X	CX	X	ASYNC	Internal Node CX to Port X
H	H	L	X	DX	X	ASYNC	Internal Node DX to Port X
(Notes 2, 3)	(Notes 2, 3)	H (Note 1)	⎓	(Note 3)	(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SC must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs XSEL(0) and XSEL(1) steady to preset internal sync registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** XSEL(0) and XSEL(1) levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

### 2nd Level X Side Data Path Select Function Table for Port Y

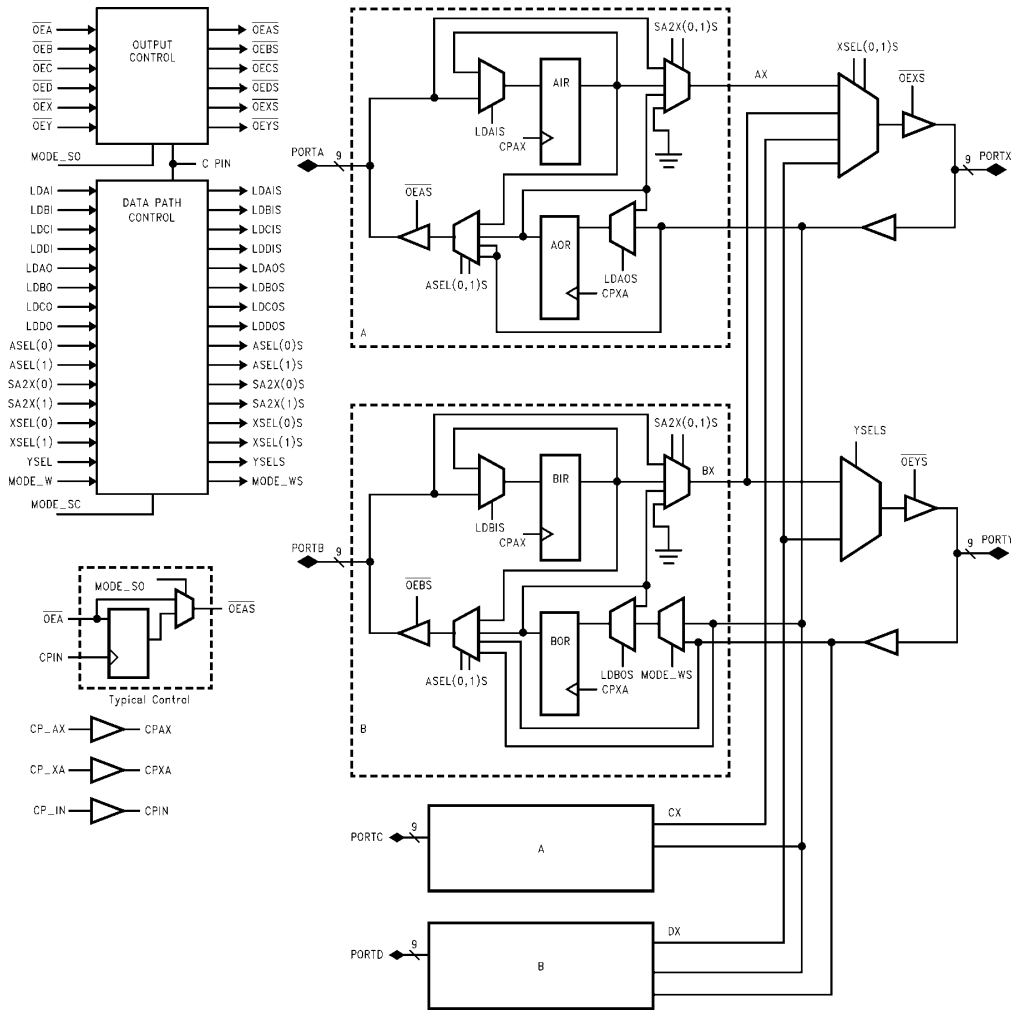

Inputs			Data Path		Control Mode	Function
YSEL	MODE__SC	CP__IN	From Internal Node	To Port		
L	L	X	BX	Y	ASYNC	Internal Node BX to Port Y
H	L	X	DX	Y	ASYNC	Internal Node DX to Port Y
(Notes 2, 3)	H (Note 1)	⎓	(Note 3)	(Note 3)	SYNC	(Note 3)

**Note 1:** Low to High transitions of MODE\_\_SC must be immediately preceded by a low to high transition (clock edge) on CP\_\_IN while holding Synchronous Control Inputs YSEL steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

**Note 2:** YSEL levels are synchronously asserted by the positive transition of CP\_\_IN when MODE\_\_SC is high.

**Note 3:** Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP\_\_IN.

## Absolute Maximum Ratings (Note 1)

Storage Temperature	-65°C to +150°C
Ambient Temperature under Bias	-55°C to +125°C
Junction Temperature under Bias	
Ceramic	-55°C to +175°C
Plastic	-55°C to +150°C
V <sub>CC</sub> Pin Potential to Ground Pin	-0.5V to +7.0V
Input Voltage (Note 2)	-0.5V to +7.0V
Input Current (Note 2)	-30 mA to +5.0 mA
Voltage Applied to Any Output in the Disabled or Power-off State in the HIGH STATE	-0.5V to +5.5V -0.5V to V <sub>CC</sub>
Current Applied to Output in LOW State (Max)	twice the rated I <sub>OL</sub> (mA)

DC Latchup Source Current	-300 mA
Over Voltage Latchup (I/O)	10V

**Note 1:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** Either voltage limit or current limit is sufficient to protect inputs.

## Recommended Operating Conditions

Free Air Ambient Temperature	
Commercial	-40°C to +85°C
Supply Voltage	
Commercial	+4.5V to +5.5V
Minimum Input Edge Rate	( $\Delta V/\Delta t$ )
Data Input	50 mV/ns
Enable Input	20 mV/ns
Clock Input	100 mV/ns

## AC Operating Requirements Single Output Switching

Symbol	Parameter	74ABT	74ABT	Units
		$T_A = 25^\circ\text{C}$ $V_{CC} = 5.0\text{V}$ $C_L = 50\text{ pF}$	$T_A = -40^\circ\text{C to } +85^\circ\text{C}$ $V_{CC} = 4.5\text{V to } 5.5\text{V}$ $C_L = 50\text{ pF}$	
		Min	Max	
$t_s(\text{H})$ $t_s(\text{L})$	Setup Time High or Low A, B, C, D X or Y. Data to CP_AX ↑ or CP_XA ↑ (Registered Mode)	4.0	4.0	ns
$t_h(\text{H})$ $t_h(\text{L})$	Hold Time High or Low A, B, C, D X or Y. Data to CP_AX ↑ or CP_XA ↑ (Registered Mode)	0.0	0.0	ns
$t_s(\text{H})$ $t_s(\text{L})$	Setup Time High or Low Control Inputs to CP_IN ↑. (Synchronous Mode)	3.0	3.0	ns
$t_h(\text{H})$ $t_h(\text{L})$	Hold Time High or Low Control Inputs to CP_IN ↑. (Synchronous Mode)	0.0	0.0	ns
$t_s(\text{H})$	Setup Time High, CP_IN ↑ to CP_AX ↑ or CP_XA ↑.	5.0	5.0	ns
$t_h(\text{L})$	Hold Time Low, CP_IN ↑ to CP_AX ↑ or CP_XA ↑.	0.0	0.0	ns
$t_w(\text{H})$ $t_w(\text{L})$	CLK Pulsewidth High CLK Pulsewidth Low	3.0 4.0	3.0 4.0	ns

## Capacitance

Symbol	Parameter	Typ	Units	Conditions $T_A = 25^\circ\text{C}$
$C_{IN}$	Input Capacitance	5	pF	$V_{CC} = 0\text{V}$ Control Inputs
$C_{I/O}$ (Note 1)	I/O Capacitance	11	pF	$V_{CC} = 5.0\text{V}$ ( $A_n, B_n, C_n, D_n, X_n, Y_n$ )

**Note 1:**  $C_{I/O}$  is measured at frequency  $f = 1\text{ MHz}$ , per MIL-STD-883B, Method 3012.

**Physical Dimensions** inches (millimeters)

**100-Lead Thin Quad Flatpak (TQFP)  
NS Package Number VJG100A**

VJG100A (REV. C)

**LIFE SUPPORT POLICY**

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
