DM74LS165 8-Bit Parallel In/Serial Output Shift Registers

FAIRCHILD

SEMICONDUCTOR

DM74LS165 8-Bit Parallel In/Serial Output Shift Registers

General Description

This device is an 8-bit serial shift register which shifts data in the direction of Q_A toward Q_H when clocked. Parallel-in access is made available by eight individual direct data inputs, which are enabled by a low level at the shift/load input. These registers also feature gated clock inputs and complementary outputs from the eighth bit.

Clocking is accomplished through a 2-input NOR gate, permitting one input to be used as a clock-inhibit function. Holding either of the clock inputs HIGH inhibits clocking, and holding either clock input LOW with the load input HIGH enables the other clock input. The clock-inhibit input should be changed to the high level only while the clock input is HIGH. Parallel loading is inhibited as long as the load input is HIGH. Data at the parallel inputs are loaded directly into the register on a HIGH-to-LOW transition of the shift/load input, regardless of the logic levels on the clock, clock inhibit, or serial inputs.

Features

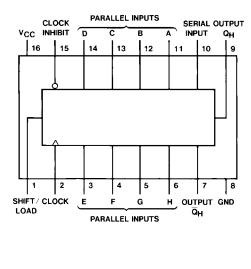

- Complementary outputs
- Direct overriding (data) inputs
- Gated clock inputs
- Parallel-to-serial data conversion
- Typical frequency 35 MHz
- Typical power dissipation 105 mW

Ordering Code:

| Order Number | Package Number | er Package Description | | | |
|--------------|----------------|---|--|--|--|
| DM74LS165M | M16A | 16-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150 Narrow | | | |
| DM74LS165WM | M16B | 16-Lead Small Outline Intergrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide | | | |
| DM74LS165N | N16E | 16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide | | | |

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code

Function Table

| Inputs | | | | | | rnal | | | |
|--------|---------|------------|--------|----------|----------|----------|-----------------|--|--------|
| Shift/ | Clock | Clock | Serial | Parallel | Outputs | | Outputs | | Output |
| Load | Inhibit | | | АН | Q_A | Q_B | Q _H | | |
| L | Х | Х | Х | ah | а | b | h | | |
| Н | L | L | Х | Х | Q_{A0} | Q_{B0} | Q _{H0} | | |
| Н | L | Ŷ | н | Х | н | Q_{An} | Q _{Gn} | | |
| Н | L | \uparrow | L | Х | L | Q_{An} | Q _{Gn} | | |
| Н | Н | Х | Х | Х | Q_{A0} | Q_{B0} | Q_{H0} | | |

H = HIGH Level (steady state) L = LOW Level (steady state)

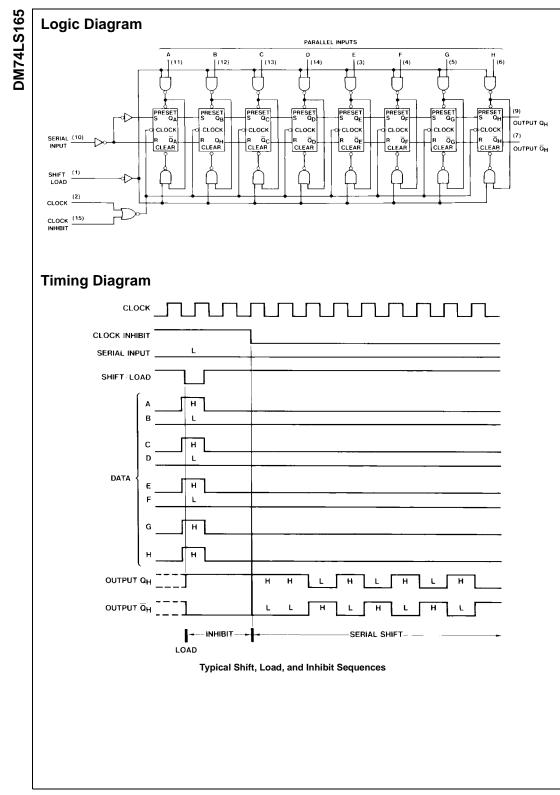

X = Don't Care (any input, including transitions) $\uparrow = Transition from LOW-to-HIGH level$

a...h = The level of steady-state input at inputs A through H, respectively. ${\rm Q}_{A0},\,{\rm Q}_{B0},\,{\rm Q}_{H0}$ = The level of ${\rm Q}_A,\,{\rm Q}_B,\,{\rm or}\;{\rm Q}_H,$ respectively, before the

indicated steady-state input conditions were established. $Q_{An}, Q_{Gn} =$ The level of Q_A or Q_G , respectively, before the most recent

↑ transition of the clock.

Absolute Maximum Ratings(Note 1)

| Supply Voltage | 7V |
|--------------------------------------|--------------------------------|
| Input Voltage | 7V |
| Operating Free Air Temperature Range | $0^{\circ}C$ to $+70^{\circ}C$ |
| Storage Temperature Range | -65°C to +150°C |

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 5: All typicals are at V_{CC} = 5V, T_A = 25° C.

Note 6: Not more than one output should be shorted at a time, and the duration should not exceed one second.

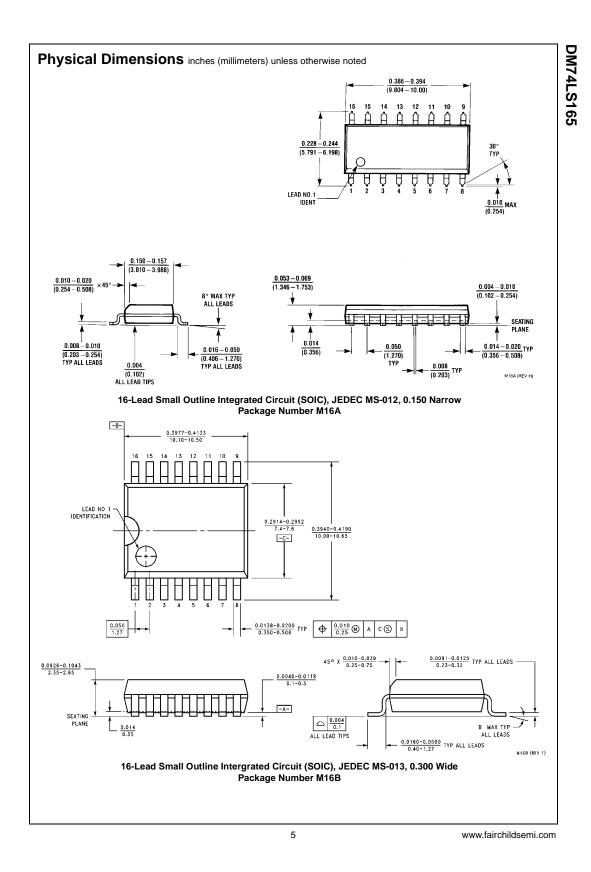

Note 7: With all outputs OPEN, clock inhibit and shift/load at 4.5V, and a clock pulse applied to the CLOCK input, I_{CC} is measured first with the parallel inputs at 4.5V, then again grounded.
