

DM74LS169A Synchronous 4-Bit Up/Down Binary Counter

General Description

This synchronous presettable counter features an internal carry look-ahead for cascading in high-speed counting applications. Synchronous operation is provided by having all flip-flops clocked simultaneously, so that the outputs all change at the same time when so instructed by the count-enable inputs and internal gating. This mode of operation helps eliminate the output counting spikes that are normally associated with asynchronous (ripple clock) counters. A buffered clock input triggers the four master-slave flip-flops on the rising edge of the clock waveform.

This counter is fully programmable; that is, the outputs may each be preset either high or low. The load input circuitry allows loading with the carry-enable output of cascaded counters. As loading is synchronous, setting up a low level at the load input disables the counter and causes the outputs to agree with the data inputs after the next clock pulse.

The carry look-ahead circuitry permits cascading counters for n-bit synchronous applications without additional gating. Both count-enable inputs $(\overline{P} \text{ and } \overline{T})$ must be low to count. The direction of the count is determined by the level of the up/down input. When the input is high, the counter counts up; when low, it counts down. Input \overline{T} is fed forward to enable

the carry outputs. The carry output thus enabled will produce a low-level output pulse with a duration approximately equal to the high portion of the $Q_{\rm A}$ output when counting up, and approximately equal to the low portion of the $Q_{\rm A}$ output when counting down. This low-level overflow carry pulse can be used to enable successively cascaded stages. Transitions at the enable \overline{P} or \overline{T} inputs are allowed regardless of the level of the clock input. All inputs are diode clamped to minimize transmission-line effects, thereby simplifying system design.

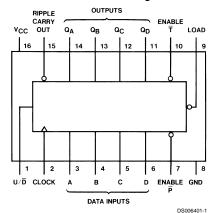

This counter features a fully independent clock circuit. Changes at control inputs (enable \overline{P} , enable \overline{T} , load, up/down), which modify the operating mode, have no effect until clocking occurs. The function of the counter (whether enabled, disabled, loading, or counting) will be dictated solely by the conditions meeting the stable setup and hold times.

Features

- Fully synchronous operation for counting and programming.
- Internal look-ahead for fast counting.
- Carry output for n-bit cascading.
- Fully independent clock circuit

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: C_L = 15 pF, R_L = 2 k Ω , T_A = 25°C and V_{CC} = 5V.

Note 3: $C_L = 50$ pF, $R_L = 2 \text{ k}\Omega$, $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 5\text{V}$.

Note 4: $T_A = 25^{\circ}C$ and $V_{CC} = 5V$.

Note 8: The propagation delay from UP/DOWN to RIPPLE CARRY must be measured with the counter at either a minimum or a maximum count. As the logic level of the up/down input is changed, the ripple carry output will follow. If the count is minimum, the ripple carry output transition will be in phase. If the count is maximum, the ripple carry output will be out of phase.
