Quad 2-Input NAND Gatewith High Voltage Open-Collector Outputs

General Description

This device contains four independent gates each of which performs the logic NAND function. The open-collector outputs require external pull-up resistors for proper logical operation.

These gates feature high-voltage output ratings (up to 15V) for interfacing with 12V systems. Although the outputs are rated for 15V, the device supply is still rated for 5V.

Pull-Up Resistor Equations

$$R_{MAX} = \frac{V_{O} (Min) - V_{OH}}{N_{1} (I_{OH}) + N_{2} (I_{IH})}$$

$$\mathsf{R}_{\mathsf{MIN}} = \frac{\mathsf{V}_{\mathsf{O}}\left(\mathsf{Max}\right) - \mathsf{V}_{\mathsf{OL}}}{\mathsf{I}_{\mathsf{OL}} - \mathsf{N}_{\mathsf{3}}\left(\mathsf{I}_{\mathsf{IL}}\right)}$$

Where:

 $N_1 \ (I_{OH}) = total \ maximum \ output \ high \ current$ for all outputs tied to pull-up resistor

 $N_2 \; (I_{IH}) = total \; maximum \; input \; high \; current \; for \; all \; inputs \; tied \; to \; pull-up \; resistor$

 N_3 ($I_{|L}$) = total maximum input low current for

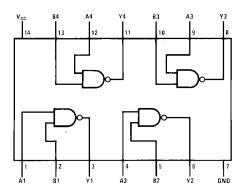

all inputs tied to pull-up resistor

Storage Temperature Range $-65^{\circ}C$ to $+150^{\circ}C$ Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
