

MM88C29 • MM88C30

Quad Single-Ended Line Driver • Dual Differential Line Driver

General Description

The MM88C30 is a dual differential line driver that also performs the dual four-input NAND or dual four-input AND function. The absence of a clamp diode to V_{CC} in the input protection circuitry of the MM88C30 allows a CMOS user to interface systems operating at different voltage levels. Thus, a CMOS digital signal source can operate at a V_{CC} voltage greater than the V_{CC} voltage of the MM88C30 line driver. The differential output of the MM88C30 eliminates ground-loop errors.

The MM88C29 is a non-inverting single-wire transmission line driver. Since the output ON resistance is a low 20Ω typ., the device can be used to drive lamps, relays, solenoids, and clock lines, besides driving data lines.

Features

- Wide supply voltage range: 3V to 15V
- High noise immunity: $0.45 V_{CC}$ (typ.)

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The Electrical Characteristics tables provide conditions for actual device operation.

Note 2: AC Parameters are guaranteed by DC correlated testing.

Typical Applications

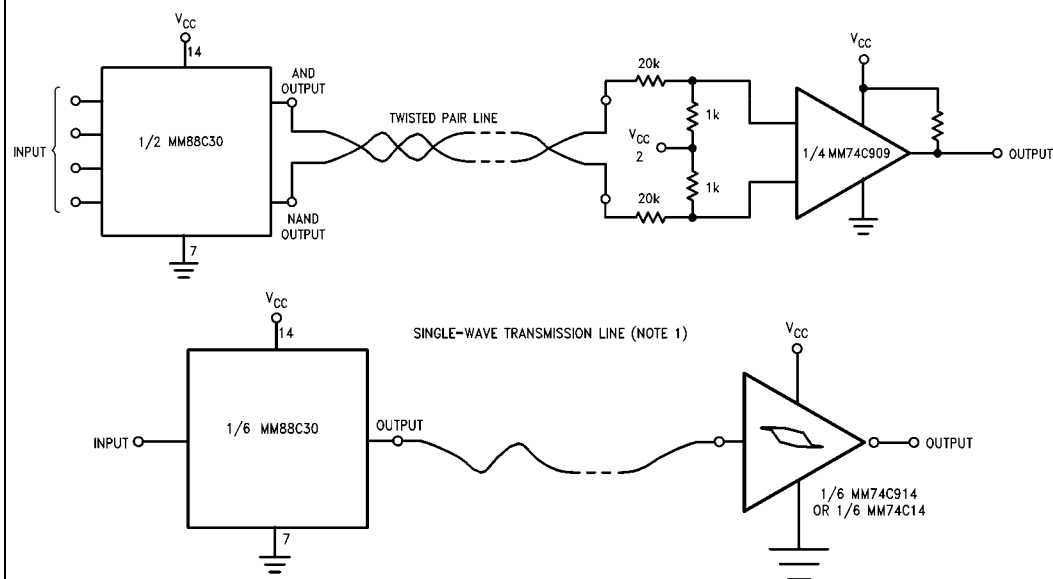

Digital Data Transmission

Note A: Exact value depends on line length.

Note B: Optional to control response time.

Note C: V_{CC} = 4.5V to 5.5V for the DS7820, V_{CC} = 4.5V to 15V for the DS78C20.

V_{CC} is 3V to 15V.

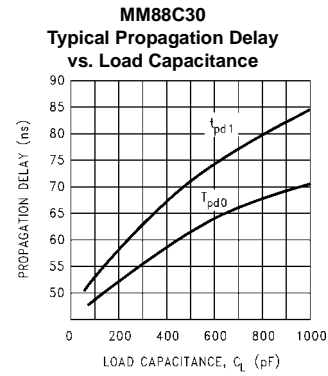

Typical Data Rate vs Transmission Line Length

Note: The transmission line used was #22 gauge unshielded twisted pair (40k termination).

Note: The curves generated assume that both drivers are driving equal lines, and that the maximum power is 500 mW/package.
