Description

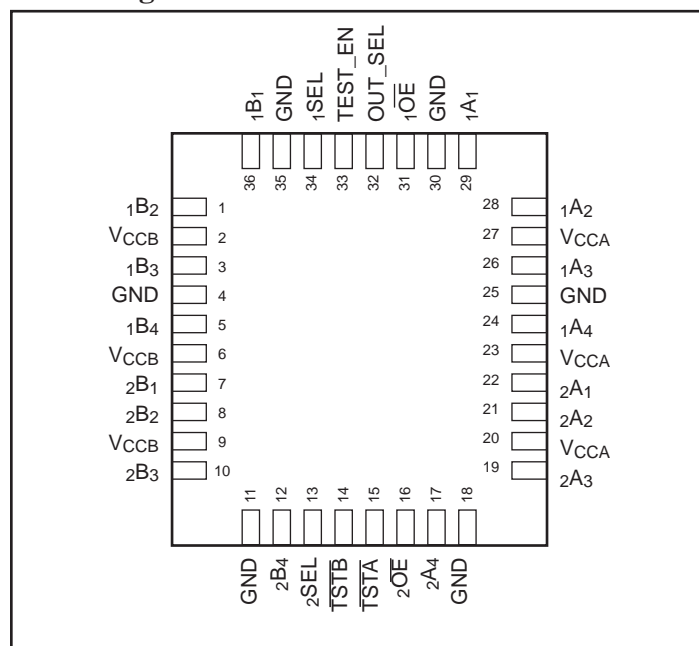

PI4ULS3V08, is a 8-bit (octal) non-inverting bus transceiver with two separate supply rails: A port (V_{CCA}) and B port (V_{CCB}) are set to operate at 1.2V to 3.6V. This arrangement permits universal bidirectional translation of differential signal levels over the voltage ranges.

The PI4ULS3V08 is designed for asynchronous communication between data buses. Data is transmitted from the A bus to the B bus, or vice versa, without direction control. All A_X and B_X are tri-stated when data is coming from both directions at the same time. The output-enable (\overline{OE}) input is used to disable outputs so buses are isolated.

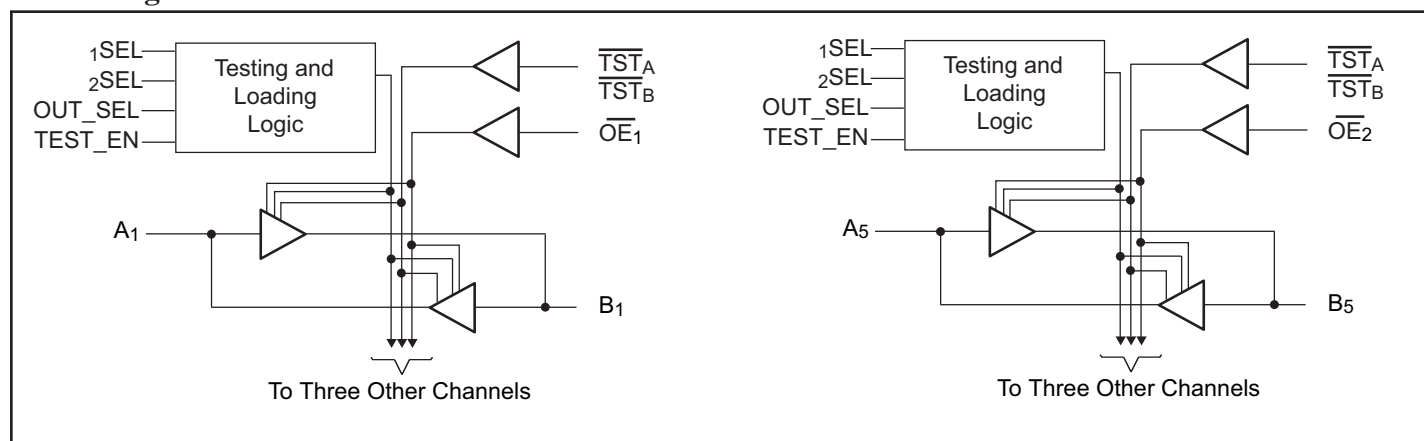

The control pins, \overline{xSEL} , \overline{OE} , $\overline{TEST_EN}$ and $\overline{OUT_SEL}$ are supplied by V_{CCB} .

To ensure the high impedance state during power-up or power-down, the output-enable (\overline{OE}) input should be tied to V_{CC} through a pullup resistor: the minimum value of the resistor is determined by the current-sinking capability of the driver.

Note:

1. The input negative voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
2. This value is limited to 3.6V maximum.
3. The package thermal impedance is calculated in accordance with JESD 51.
4. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
