Features

- Fast Read Access Time 120 ns, see AT27BV020 for Faster Speeds
- Dual Voltage Range Operation
 - Low Voltage Power Supply Range, 3.0V to 3.6V or Standard 5V ± 10% Supply Range
- Compatible with JEDEC Standard AT27C020
- Low Power CMOS Operation
 - 20 μ A Max (Less than 1 μ A Typical) Standby for V_{CC} = 3.6V
 - 29 mW Max Active at 5 MHz for $V_{CC} = 3.6V$
- JEDEC Standard Packages
 - 32-lead PLCC
 - 32-lead TSOP
 - 32-lead VSOP
- High Reliability CMOS Technology
 - 2,000V ESD Protection
 - 200 mA Latchup Immunity
- Rapid Programming Algorithm 100 µs/Byte (Typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
 - JEDEC Standard for LVTTL
- Integrated Product Identification Code
- Industrial Temperature Range
- Green (Pb/Halide-free) Packaging Option

1. Description

The AT27LV020A is a high-performance, low-power, low-voltage 2,097,152 bit one-time programmable read-only memory (OTP EPROM) organized as 256K by 8 bits. It requires only one supply in the range of 3.0 to 3.6V in normal read mode operation, making it ideal for fast, portable systems using battery power.

Atmel's innovative design techniques provide fast speeds that rival 5V parts while keeping the low power consumption of a 3V supply. At $V_{CC}=3.0V$, any byte can be accessed in less than 120 ns. With a typical power dissipation of only 18 mW at 5 MHz and $V_{CC}=3.3V$, the AT27LV020A consumes less than one fifth the power of a standard 5V EPROM. Standby mode supply current is typically less than 1 μ A at 3.3V.

The AT27LV020A is available in industry-standard JEDEC approved one-time programmable (OTP) plastic PLCC, TSOP, and VSOP. All devices feature two-line control ($\overline{\text{CE}}$, $\overline{\text{OE}}$) to give designers the flexibility to prevent bus contention.

The AT27LV020A operating with $V_{\rm CC}$ at 3.0V produces TTL level outputs that are compatible with standard TTL logic devices operating at $V_{\rm CC}$ = 5.0V. The device is also capable of standard 5-volt operation making it ideally suited for dual supply range systems or card products that are pluggable in both 3-volt and 5-volt hosts.

Atmel's AT27LV020A has additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μ s/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27LV020A programs exactly the same way as a standard 5V AT27C020 and uses the same programming equipment.

3. System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed datasheet limits, resulting in device non-conformance. At a minimum, a 0.1 μ F high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the V_{CC} and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μ F bulk electrolytic capacitor should be utilized, again connected between the V_{CC} and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

*NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes: 1. Minimum voltage is -0.6V DC which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is $V_{CC} + 0.75V$ DC which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0V for pulses of less than 20 ns.

Notes: 1. X can be V_{IL} or V_{IH} .

- 2. Read, output disable, and standby modes require, 3.0V \leq V_{CC} \leq 3.6V, or 4.5V \leq V_{CC} \leq 5.5V.
- 3. Refer to Programming Characteristics. Programming modes require $V_{CC} = 6.5V$.
- 4. $V_H = 12.0 \pm 0.5V$.
- 5. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}) , except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

Note: 1. The AT27LV020A has the same Product Identification Code as the AT27C020. Both are programming compatible.

18. Rapid Programming Algorithm

A 100 μs \overline{PGM} pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μs \overline{PGM} pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0V and V_{CC} to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.
